Service Precautions

In order to carry out work safely

1. Always use an engine stand when taking the engine down from the vehicle. Do not place the engine directly onto the ground, or place in a manner that interferes with the oil pan.

2. If you are working together with others, always pay attention to each other's safety.

3. If you are repairing any part of the electrical system, always remove the minus side cable from the battery terminal before starting work. If you are removing the battery cover, always remove the cover in a place that is away from sources of fire/heat.

4. Do not perform painting work or leave the engine running for long periods of time in an enclosed or badly ventilated indoor workshop.

5. Always use the correct specialized tool indicated in the instructions. Using the incorrect tool may cause damage to the parts or injury to the person using the tool.

6. All regular tools, gauges and special tools should be regularly inspected, and prepared before starting work. Do not use bent spanners, hammers with damaged edges, chipped chisels, or any other faulty or damaged tools.
7. Always pay close attention to safety and handling requirements when using grinders, cranes, welders, and other such equipment. Moreover, always wear the correct protective garments and use the necessary safety tools for the job in hand.

8. Always check that there are no fuel leaks when performing maintenance work on the fuel system. (It may cause a fire.)

9. Pay close attention to the risk of ignition if you are handling parts that carry a high voltage. Furthermore, any oil or grease spilt onto rubber parts must be wiped off immediately, as it will cause deterioration of the rubber.

Replacement parts and part numbers

1. Always replace packing, oil seals, O-rings, caulk- ing lock nuts, folding lock plates, split pins and other such parts with brand new parts.

2. The parts numbers contained in this manual may not represent the supply condition of the parts, and the part numbers may be changed due to revisions. Therefore, parts should always be checked against a parts catalogue before use.
Liquid gasket

1. Each time you disassemble parts that use liquid gasket, completely remove the old gasket residue from each of the parts and matching sections using a scraper, then clean each of the parts to completely remove oil, water, and dirt etc. from the various surfaces by a cloth. Using the specified type of liquid gasket, apply new liquid gasket to each of the surfaces before reassembling the parts.

2. In order to make it easier to clean liquid gasket surfaces, apply gasket remover liquid (Pando-391D made by ThreeBond Co., Ltd.) and leave the part to stand for approximately 10 minutes, after which the old liquid gasket residue will be easier to remove. However, this should not be used on resin components or painted components.

3. Please take care not to apply too much or too little liquid gasket. Also, you should always re-apply the liquid gasket upon itself when you start and finish application.

4. Make sure that there are no gaps when reinstalling the liquid gasket parts to each other. If there are gaps between the two parts, re-apply the liquid gasket. Some parts, especially the oil pan, use the same size studs as a guide to eliminate the need for knock pin positioning etc.

5. Re-install these parts within 5 minutes of applying the liquid gasket. If more than 5 minutes passes, remove the previous liquid gasket and re-apply it.

6. Please wait for at least 30 minutes since the last part is installed before starting the engine.

- Always use the liquid gasket products listed above, or a liquid gasket identical to the ones listed above.
- Use the correct quantity of liquid gasket. Always follow the handling instructions for each product.
Application procedure
1. Wipe the contact surfaces clean of all water, oil or grease. The contact surfaces should be dry.
2. Apply a regular bead width of liquid gasket to one of the contact surfaces. Make sure that the bead does not break at this point.

Note:
If there are special regulations concerning the application procedure in the repair document, please follow those regulations.

Work procedure
1. Wipe the joint surfaces of the bolt, bolt hole, and threads clean of water, grease, and oil. The contact surfaces should be dry.
2. Apply Loctite to the top 1/3 of the screw.
3. Tighten the bolt to the specified torque.

Example:
Procedure for measuring the clearance between the connecting rod bearing and crank pin.
- Clean the connecting rod and bearing, and install the bearing to the rod.
- Cut the plastigauge to the same width as the crank pin, and while avoiding the oil hole of the crank pin lay the gauge parallel to the pin.
- Line up the marks on the connecting rod and cap, and install the crank pin. Apply molybdenum disulfide to the thread section and seating surface of the tightening bolt, and rotate both cap and bolt to the correct torque.

Important:
Do not move the connecting rod while using the plastigauge.
- Gently remove the cap and connecting rod, and measure the crushed width of the plastigauge (clearance between rod and pin) using the scale printed on the bag.

Important:
After tightening the bolt, do not apply excessive torque or try to rotate the bolt until at least one hour has passed, and the Loctite has hardened.

Procedure for using the plastigauge

</tr>
</tbody>
</table>
Example: Measuring the clearance between the crank bearing and crank journal

- Clean the clamp face of the cylinder block and crankcase bearing, and also the bearing, and install the cylinder block to the crankcase.
- Gently rest the crankshaft on the cylinder block, and rotate it approximately 30 degree to stabilize it.
- Cut the plastigauge to the same size as the journal width, and while avoiding the oil hole of the journal lay the gauge parallel to the journal.
- Gently rest the crankcase on the cylinder block, apply molybdenum disulfide to the thread section and seating surface of the tightening bolt, and tighten in sequence to the correct torque.

Important:
Do not rotate the crankshaft while using the plastigauge.

- Gently remove the crankcase, and measure the crushed width of the plastigauge (clearance between bearing and journal) using the scale printed on the bag.

General Information

Terminology, description of abbreviations

Terminology definitions

Maintenance standard
The generic name for reference values required for maintenance, such as nominal dimension, assembly specification, and limit.

Nominal dimension
Shows the standard value at the point of manufacture that does not include the common difference.

Assembly specification
Shows the standard value after assembling, repairing, or adjusting.

Service limit
When this value (dimensions) is reached, it shows that the part has reached its full limit and must be replaced or repaired.

Wear
Shows the difference between the dimension of non-worn part (nominal dimension unless there is such part) and that of the most worn part (the dimension of worn part).

Uneven wear
Shows the difference between the maximum and the minimum wear amount.

Front/Rear, Right/Left, Top/Bottom
These show each orientations of parts installed to the vehicle when looking from the vehicle's forward direction.

Unit
Units written to SI conventions (mainly torque, pressure, force)
[Example] Length: mm, Torque: N⋅m (kgf-m)

Warning
Items that carry the warning mark pose a danger to life or threat of serious injury if not strictly observed.

Caution
Items that carry the caution mark may cause injury or lead to accidents if not strictly observed.

Important
Items that carry the important mark may cause the vehicle to break down, or may prevent the guaranteed normal operation of the system or related parts if not strictly observed.

Note
Items that should receive special mention within a work procedure.

With regards to the conversion to SI (International System of Units)

The introduction of the SI systems aims to internationally unify the metric system and the various units used by different countries (traditional weights and measures, the foot pound method etc.), and to curb the confusion that occurs between the different units (conversion calculations etc.).

The new calculating method which adopted SI units was completely adopted in Japan in 1992, and is standardized by JIS-Z-8203.

All of the units in this manual are written in line with the International System of Units SI units, and conventional units are written in { } brackets.

SI
Abbreviation of French word “Le Systeme International d’Unites”

### Connection between main SI units and conventional units

<table>
<thead>
<tr>
<th>SI</th>
<th>Conventional unit</th>
<th>Item, unit conversion</th>
</tr>
</thead>
<tbody>
<tr>
<td>Length</td>
<td>m (meter)</td>
<td>m</td>
</tr>
<tr>
<td>Weight (Mass)</td>
<td>kg (kilogram)</td>
<td>kg</td>
</tr>
<tr>

<td>m³ (cubic meter)</td>
<td>Liter, L, cc</td>
</tr>
<tr>
<td>Fuel consumption</td>
<td>g/(kW·h)</td>
<td>g/(PS·h)</td>
</tr>
</tbody>
</table>

*1* Published service data may conveniently use kg for force and mass (weight) instead of kgf.

*2* Some conversion results may be rounded off to 1 or 2 decimal places.

### Converting expressions of quantity

When converting, prefixes such as k (kilo) or m (milli) are used.

### SI (International System of Units)

#### Conversion formula

**Length**
- $\text{km} \times 0.6214 = \text{mile}$
- $\text{m} \times 3.281 = \text{ft}$
- $\text{mm} \times 0.03937 = \text{in}$

**Pressure**
- $\text{kPa} \times 0.0101972 = \text{kg/cm}^2$
- $\text{kPa} \times 0.145038 = \text{psi}$
- $\text{MPa} \times 10.197162 = \text{kg/cm}^2$
- $\text{MPa} \times 145.03774 = \text{psi}$

**Tightening torque**
- $\text{N·m} \times 0.101972 = \text{kg·m}$
- $\text{N·m} \times 0.737562 = \text{lb·ft}$

**Speed**
- $\text{km/h} \times 0.6214 = \text{MPH}$

**Temperature**
- $^\circ\text{C} \times 1.8 + 32 = ^\circ\text{F}$

- 200 kgf/cm² = 19,620 kPa = 19.6 MPa
- 40 mmHg = 5,332 Pa = 5.3 kPa
Table of Isuzu standard tightening torque
The tightening torque values in the table below apply to all situations unless a special tightening torque is specified.

Isuzu standard bolts, nuts

About angle method tightening

Though the general and current way to tighten bolts and nuts is torque indication, using this way results in large unevenness of shaft power to indicated torque. Therefore, bolts may be damaged at upper limit when you try to ensure minimal shaft power.

To ensure shaft power with small unevenness, it is necessary to tighten bolts measuring stretch amount of bolts, but this is actually impossible. So the angle method focuses on screw pitch as equivalent to bolt stretch, and controls using the screw rotation amount. The method can reduce the unevenness of shaft power by tightening to plastic range.

How to tighten

1. Apply molybdenum disulfide or engine oil to the threads and the seating surface of the bolt following the instruction.
2. Tighten all bolts to the pre-indicated tightening torque.
3. Draw lines on the surface of the parts you tighten: the lines which pass through the bolt’s center (A — B: bolt side) (C — D: parts side) and the line at the specified tightening angle from the bolt’s center (E — F).
4. Tighten the bolt with wrench until the line on the bolt (A — B) aligns with the specified angle line (E — F on the surface of the parts).

Name

1. Specified Tightening Torque

Important:

- Follow the instructed order to tighten bolts.
- Do not retighten if you tighten by the angle method.

Bolt angle gauge (5-8840-0266-0), the tool for tightening bolts by the angle method, is set.

Special tool classification

A; Essential tool
Servicing operation cannot be done with any other tools than the essential tool.

B; Recommend tool
Servicing work can be done with a general-purpose tool commercially available. However, it is advisable to use the recommended tool as much as possible for a reduced work time and an improved safety in work operations.

C; Available tool
Although it takes a more working time, servicing operations can be made with a tool commercially available as substitute for the available tool.
Recommended Lubricant

Engine oil

Use the engine oil below.

Engine oil grade

<table>
<thead>
<tr>
<th>Engine classification</th>

<td>* (CE, CF, CH-4, CI-4 or CI-4 Plus)</td>
</tr>
</tbody>
</table>

* mark may vary depending on each machine. Refer to the machine manufacturer specification.

ISUZU genuine engine oil

Besco Super: CC
Besco S — 3: CD
Besco Multi Z: CD

Engine oil viscosity chart

The engine oil affects the startability, driving performance, oil consumption, wear of the sliding part, and seizure, depending on the viscosity. You should select the engine oil depending to a temperature and the chart above.

Engine oil level

4LE1T model: Approx. 7.6 — 10.3 L (8.0 — 10.9 qts)
4LE1N model: Approx. 5.9 — 8.4 L (6.2 — 8.9 qts)

Note:
Engine oil level may vary depending on the machine specification.
List of Trouble Symptom

Engine does not start

- Starter does not run
  - Check battery
  - Battery in discharging (Charge)
    - Check wiring
    - Loosened connector or broken wire (Retighten or replace with new wiring)
      - Check starter switch
      - Defective (Replace)
      - Check magnetic switch
      - Defective (Replace)
      - Check starter bush
      - Poor contact (Repair or replace)
      - Defective starter (Bring it to a specialty shop for repair)

- Engine starts but does not run continuously.
  - Air mixed in fuel pump
    - Retighten, replace packing, bleed air

- Engine does not start
  - Starter runs but does not start
    - Engine
      - Check compression pressure
    - Fuel system
      - No fuel injected
        - Check if fuel comes to fuel pump
      - Fuel injected
        - Check preheating circuit
        - Normal operation of glow plug control resistance OK
        - Poor operation of glow plug control resistance (Replace)
      - Air mixed (Retighten it, replace packing, bleed air)
        - Check for air mixing
        - Check fuel filter
          - Clogged (Clean)
        - Check injection timing
          - Abnormal (Adjust)
          - Check nozzle
            - Defective (Replace or replace)
            - Defective injection pump (Bring it to a specialty shop for repair)
            - Replace the EGR cut solenoid and valve case by the set
              - (*3) Refer to "EGR Control" in the Exhaust System section.

Note: "Bring it to a specialty shop" means that defective parts of the injection pump and electricals must be brought to a specialty shop for repair. (This note is applicable to all the following procedures.)
Engine speed lacks smoothness

Unstable engine rotation

- Unstable engine idling
  - Defective idling adjustment
  - Defective valve return (Adjust)
  - Check high pressure pipe for cracking, clogging or bending
  - Cracked, clogged or bent (Replace)
  - Check nozzle
  - Defective (Repair or replace)
  - Check cylinder for uneven compression pressure
  - Uneven compression pressure (Adjust)
  - Defective injection pump (Bring it to a specialty shop for repair)
- Idling speed too high
  - OK
- Unstable rotation at medium speed (Hunting)
  - Governor spring deteriorated
  - Check fuel for air mixing
  - Air mixed (Bleed air)
  - Crash (Replace)
  - OK
- Check fuel pipe for crash
  - Defective injection pump (Bring it to a specialty shop for repair)
  - OK
- Unstable rotation at high speed
  - Check fuel filter for clogging
  - Clogged (Clean or replace)
  - OK
- Check no uneven fuel injection
  - Uneven (Adjust)
  - OK
- Check valve clearance adjustment
  - Poor adjustment (Adjust)
  - OK
- Defective injection pump (Bring it to a specialty shop for repair)
- Engine does not change from high to low rotation
  - Check accelerator pedal
  - OK

OK
Output shortage

- Insufficient output
  - Fuel system
    - Check fuel for air mixing
      - Air mixed (Bleed air) OK
    - Check fuel filter or fuel hose for clogging
      - Clogged (Clean or Replace) OK
    - Check high pressure pipe for clogging or bending
      - Clogged or bent (Replace) OK
  - Mechanical system
    - Check engine control
      - Poor adjustment (Adjust) OK
    - Check inlet air temperature
      - Temperature too high (Improve ventilation) OK
  - Insufficient inlet air
    - Air cleaner stained (Clean or replace) OK
  - Check nozzle
    - Defective (Repair or replace) OK
  - Check injection timing
    - Abnormal (Adjust) OK
  - Defective injection pump (Bring it to a specialized shop for repair)
  - There is insufficient torque and a lot of black smoke at low-speed
    - Check for the stuck EGR valve (opened position) (*)
      - Replace the EGR cut solenoid and valve case by the set OK
    - Check the fuel system and mechanical system

(*) Refer to "EGR Control" in the Exhaust System section.
Overheat

- Cooling system
  - Check cooling water level
    - Insufficient
      - Replenish
    - Leak to internal
      - Repair or replace
    - Leak to external
      - Repair
  - Check for leakage
- Check fan belt for slip
  - Slipping
    - (Adjust)
  - Malfunction
    - (Replace)
- Check thermostat
  - OK
- Check cooling system for stain, and radiator for clogging
  - Stained or clogged
    - (Clean)
- Handling
  - Check if oil used is inferior quality, or engine oil is too much
    - Care must be taken when replenishing
      - (Replace)
    - OK
  - Engine rotation too high
    - Overloaded
    - Temperature abnormally high
      - Improve ventilation
Exhaust fault

Abnormal exhaust gas

White smoke too much
- Check if fuel used is of inferior quality
  - Change fuel OK
  - Water mixed (Change fuel) OK
- Check fuel for water mixing
- Check injection timing
  - Delayed (Adjust) OK
  - Low OK
  - Check compression ratio
  - Excessive blow-by gas (Overhaul)
  - Gas leak from valve and gasket (Repair or replace)
  - Check up and down movement of oil
    - Stuck (Overhaul)
- Defective injection pump (Bring it to a specialty shop for repair)
  - OK
- 1. Disordered valve timing
  2. Broken piston ring or misassembly
  3. Worn camshaft
  4. Worn valve or insert (Overhaul)

Black smoke too much
- Check nozzle
- Defective (Repair or replace) OK
- Check injection timing
  - Advanced too much (Adjust) OK
  - Check injection pump
- Defective injection pump (Bring it to a specialty shop for repair)
  - OK
- 1. Disordered valve timing
  2. Broken piston ring or misassembly
  3. Worn camshaft
  4. Worn valve or insert (Overhaul)

Air cleaner clogged
- Replace air cleaner element OK
- Check air hose for crash
- Air cleaner clogged (Repair or replace)
- OK

Check for the stuck EGR valve (opened position) (*)
- Replace the EGR cut solenoid and valve case by the set
- OK

(*) Refer to "EGR Control" in the Exhaust System section.
Battery over discharge

- Battery
  - Check electrolyte level
    - Low
      - Battery case cracked (Replace)
      - Natural consumption (Replenish)
      - Over charge
        - Note: Improper maintenance
      - Check specific gravity
        - Low
          - Recharge
            - Recharging impossible
              - Bring it to a battery specialty shop
          - OK
    - OK

- Wiring
  - Check terminals for warp, deformation or corrosion
    - Poor contact (Repair or replace)
      - Check for broken wire (Repair or replace)
        - OK
      - OK

- Regulator and generator
  - Check belt for slip or damage
    - Slipping or damaged (Repair or replace)
    - Test charging condition
      - Abnormal
        - OK
      - OK
  - OK

Note: Improper maintenance
Natural consumption (Replenish)
Over charge
Regulator and generator
Check for broken wire (Repair or replace)
Oil pressure is too low

- Oil pressure too low
  - Check oil level
    - Low (Replenish) OK
  - Check cooling water temperature
    - High (See "Overheat") OK
  - Check oil in crankcase
    - Improper viscosity OK
  - Water or fuel mixed. Check fuel system and cooling system
  - Check relief valve
    - Defective (Repair or replace) OK
  - 1. Oil pump malfunction
     2. Loosened or cracked pipe
     3. Wear of sliding part
     4. Oil pump clogged (Overhaul)

Fuel consumption deteriorates

- Fuel consumption too much
  - Check for fuel leakage
    - Leaking (Retighten, replace packing seal) OK
  - Check nozzle
    - Defective (Repair or replace) OK
  - Check injection timing
    - Abnormal (Adjust) OK
  - Check compression ratio
    - Low OK
    - Defective injection pump (Bring it to a specialty shop for repair)
      - Excessive blow-by gas
      - Gas leak from valve and gasket (Repair or replace)
Oil consumption deteriorates

Oil consumption too much

Check for oil leakage

Leaking (Retighten, replace packing seal) — OK

Check oil quality

Poor quality (Change to specified oil) — OK

Check bleeder for clogging

Clogged (Clean) — OK

Check up and down movement of oil

1. Oil pump malfunction
2. Loosened or cracked pipe
3. Wear of sliding part (*)
4. Oil pump clogged
5. Defective valve stem seal (Overhaul)

(*) Worn bore, and worn or broken ring (Measure compression pressure, and check entrance of dust)
Engine knocking

- Mechanical system
  - Check up movement of oil
  - Oil stained (Overhaul)
  - Check compression pressure
    - Low
      - Excessive blow-by gas (Overhaul)
- Fuel system
  - Check injection timing
  - Abnormal (Adjust)
  - Check nozzle
    - Defective
      - Gas leak from valve and gasket (Repair or replace)

Note: Fuel used is of poor quality.
Repair Standard

1. This table specifies the repair standard for **4LE1 model “ISUZU diesel engine”**.
2. This repair standard consists of items to be checked, nominal dimension, assembly specifications, service limit, and repairing procedure.
   - “Nominal dimension” is the standard value at the time of manufacture.
   - “Assembly specification” is the target value after repairing (at assembling). It may differ in some degree from “assembly dimension” of the new engine.
   - “Service limit” is the limit value of wear, etc. which must not be exceeded. When it is reached, the part should be repaired or replaced.
   - “Repairing procedure” indicates general methods to repair.
   - The unit for the numbers in the table are all **millimeter (inch)** if not otherwise specified.
3. If the whole engine is requested for repair, “check the locations which need to be repaired” first by “the bench test” or something. Then perform the minimum overhaul. If a part of engine is requested for repair, perform repairing based on this “repair standard”.
4. This repair standard may be changed in the value, specification, and others without notice due to “design change” of the engine.

Service Precautions

Service precautions about maintenance

To prevent damage to the engine and ensure reliability of its performance, pay attention to the following in maintaining the engine:

- When taking down the engine on the ground, do not make the bearing surface of the oil pan touch directly the ground. Use a wood frame, for example, to support the engine with the engine foot and the flywheel housing. Because there is only a small clearance between the oil pan and the oil pump strainer, it can damage the oil pan and the oil strainer.
- When the air duct or air cleaner is removed, cover the air intake port to prevent foreign matter from getting into the cylinder. If foreign matter gets in, it can considerably damage the cylinder and others while the engine is operating.
- When maintaining the engine, never fail to remove the battery ground cable. Otherwise, this may damage the wire harness or electrical parts. If you need electricity on for the purpose of inspection, for instance, watch out for short circuits and others.
- Apply engine oil to the sliding contact surfaces of the engine before reassembling it. This ensures adequate lubrication when the engine is first started.
- When valve train parts, pistons, piston rings, connecting rods, connecting rod bearings or crankshaft journal bearings are removed, put them in order and keep them.
- When installing them, put them back to the same location as they were removed.
- Gaskets, oil seals, O-rings, etc. must be replaced with new ones when the engine is reassembled.
- As for parts where a liquid gasket is used, remove an old liquid gasket completely and clean it up thoroughly so that no oil, water or dust may be clung to them. Then, apply the designated liquid gasket to each place anew before assembly.
- Surfaces covered with liquid gasket must be assembled within 5 minutes of gasket application. If more than 5 minutes have elapsed, remove the existing liquid gasket and apply new liquid gasket.
- When assembling or installing parts, fasten them with the specified tightening torque so that they may be installed properly.

Service precautions specific to this engine

Holes or clearances in the fuel system, which serve as a passage of fuel, including the inside of the nozzle holder, are made with extreme precision. They are therefore highly sensitive to foreign matter and the entry of foreign matter could cause serious damage. Take extreme care not to allow foreign matter to enter. When servicing the fuel system, every precaution must be taken to prevent the entry of foreign material into the system.

- Before beginning the service procedure, wash the fuel line and the surrounding area.
- Perform the service procedures with clean hands. Do not wear work gloves.
- Immediately after removing the fuel hose and/or fuel pipe, carefully tape vinyl bags over the exposed ends of the hose or pipe.
- If parts are to be replaced (fuel hose, fuel pipe, etc.), do not open the new part packaging until installation.

Work procedure

- The fuel opening must be quickly sealed when removing the fuel pipe, injection pipe, nozzle holder, and injection pump.
- The eyebolts and gasket must be stored in a clean parts box with a lid to prevent adhesion of foreign matter.
- Fuel leakage could cause fires. Therefore, after finishing the work, wipe off the fuel that has leaked out and make sure there is no fuel leakage after starting the engine.
**How to Read the Model**

1. **Stamped Engine Number**

---

**Explanations on Functions and Operation**

**Cylinder block**

The cylinder block is cast-iron with the center distance of each bore being equal and is of the highly rigid, symmetrical structure with the crankshaft center being the center.

**Piston**

The piston is aluminum-alloy and an autothermatic piston with a strut cast, while the combustion chamber is a round reentrant type.

**Cylinder head**

The cylinder head is cast-iron and there are two valves per cylinder. The angular tightening method of the cylinder head bolt further increases reliability and durability.

**Crankshaft**

The crankshaft which is stamped “N” on the front end surface is made of tufftride.

**EGR system**

Based on coolant temperature and engine speed, it is controlled by EGR cut controller to purify exhaust by recycling part of it. Its main components include an EGR cut solenoid, an EGR cooler and various sensors.

**Connecting rod cap bolt**

Do not pull out the connecting rod cap bolt from the connecting rod except when you need to replace it.

**Nozzle holder**

Multi-hole type nozzle is used for the nozzle holder.

**Sedimenter**

Sedimenter gets rid of water by making use of the difference in specific gravity between diesel oil and water.

**Preheating system**

The preheating system consists of the glow plug timer, the glow plugs and the glow indicator lamp. The preheating system is operated when the engine coolant temperature is low, and makes the engine easy to start.
Lubrication system
It is an oil filter with full-flow bypass, which uses a water-cooled oil cooler and oil jet to cool the piston.

Function Check
Inspection/adjustment of valve clearance
To do this work, use the thickness gauge when the engine is cold.

1. Rotate the crankshaft over 360 degrees into a proper direction (clockwise), and set the mark groove of the crank pulley to the TDC mark (cast) of the timing gear case cover.

2. Remove the cylinder head cover and check whether the No.1 cylinder is in the compression top dead center position or in the exhaust top dead center position.

The cylinder is in the compression top dead center position if both intake and exhaust valves are closed. The cylinder is in the exhaust top dead center position if both intake and exhaust valves are open.

3. Measure the clearance of the valve with ○ mark or × mark in the table, depending on the status of the No.1 cylinder. If the clearance is not the standard value, adjust it to the standard value using the adjusting screw.

CAUTION:
To measure the clearance, use the thickness gauge when the engine is cold.

<table>
<thead>
<tr>
<th>Valve clearance standard value</th>
<th>mm (in)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Inlet valve</td>
<td>0.40 ± 0.05 {0.016 ± 0.002} (at cold condition)</td>
</tr>
<tr>
<td>Exhaust valve</td>
<td></td>
</tr>
</tbody>
</table>
4. Rotate the crankshaft again into a proper direction, and set the mark in the same way as 1. after 3. is completed. Then measure and adjust the clearances of the remaining valves.

CAUTION:
- Rocker arm is die-cast aluminum. So do not over-tighten the rocker arm when tightening the adjusting screw.
- The load of the used valve spring is low. So do not push down the spring when measuring or adjusting the clearance.

Adjustment table

<table>

<tr>
<td>No.1 cylinder exhaust top dead center position</td>
<td>×</td>
<td>×</td>
<td>×</td>
<td>×</td>
</tr>
</tbody>
</table>

Type of the crank pulley that has two mark grooves on outer circumference

Adjustment procedure
1. Rotate the crankshaft to a proper direction (clockwise) of the engine, and set the mark groove (1) of the crank pulley to the TDC mark of the timing gear case cover.

2. Remove the cylinder head cover and check whether the No.1 cylinder is in the compression top dead center position or in the exhaust top dead center position. The cylinder is in the compression top dead center position if both intake and exhaust valves are closed. The cylinder is in the exhaust top dead center position if both intake and exhaust valves are open. Make the No.1 cylinder to the compression top dead center position.

3. Measure and adjust the valve clearance of the No.1 cylinder.

4. Rotate the crank 180 degrees clockwise from the position in step 3, and align the mark groove (2) with the TDC mark of the timing gear case cover. Measure and adjust the valve clearance of the No.3 cylinder.

5. Rotate the crank 180 degrees clockwise from the position in step 4, and align the mark groove (1) with the TDC mark of the timing gear case cover. Measure and adjust the valve clearance of the No.4 cylinder.

6. Rotate the crank 180 degrees clockwise from the position in step 5, and align the mark groove (2) with the TDC mark of the timing gear case cover. Measure and adjust the valve clearance of the No.2 cylinder.
Inspection and adjustment of injection timing

1. Remove the No.1 cylinder injection pipe.
2. Then remove the delivery valve holder of the No.1 cylinder injection pump, and pull out the delivery valve and the delivery spring.

3. Install the delivery valve holder and tighten it, leaving the delivery valve and spring removed.

   **Tightening torque:**
   39.2 — 44.1 N·m (4.0 — 4.5 kgf·m/28.9 — 32.5 lb·ft)

4. Turn the starter switch to the drive position with the lever of the sedimentor in the open position. Then rotate the crankshaft slowly feeding fuel by the electromagnetic pump, the gap with the fuel tank, the feed pump lever, etc. And when the fuel stops flowing from the delivery holder and bulging at the dent on top, stop the crankshaft rotating.

   **Note:**
   Take extreme care to rotate the crankshaft as slowly as possible and not to miss the position where the fuel stops bulging.

5. Check the degree in the timing mark on the timing gear case where the mark groove of the crank pulley is positioned in above 4. status. Adjust if the value is out of the standard value of the injection timing.

   **Note:**
   Injection timing varies depending on the machine specification.

| Step 4: Crank pulley alignment groove position (2) | ○ | ○ |
| Step 5: Crank pulley alignment groove position (1) | ○ | ○ |
| Step 6: Crank pulley alignment groove position (2) | ○ | ○ |

### Name
1. Delivery Valve Holder
2. Delivery Spring
3. Delivery Valve
4. Injection Pump

* Injection timing BTDC 2°
6. Adjust injection timing by the shim between the injection pump and the cylinder block. The following nine types of identifying symbols are stamped (or sealed) on the shim.

The identifying symbols and thickness of the shim

<table>
<thead>
<tr>
<th>Symbol</th>
<th>Thickness (mm)</th>
<th>Symbol</th>
<th>Thickness (mm)</th>
<th>Symbol</th>
<th>Thickness (mm)</th>
</tr>
</thead>
<tbody>
<tr>
<td>2</td>
<td>0.2 (0.008)</td>
<td>5</td>
<td>0.5 (0.020)</td>
<td>8</td>
<td>0.8 (0.031)</td>
</tr>
<tr>
<td>3</td>
<td>0.3 (0.012)</td>
<td>6</td>
<td>0.6 (0.024)</td>
<td>10</td>
<td>1.0 (0.039)</td>
</tr>
<tr>
<td>4</td>
<td>0.4 (0.016)</td>
<td>7</td>
<td>0.7 (0.028)</td>
<td>12</td>
<td>1.2 (0.047)</td>
</tr>
</tbody>
</table>

**CAUTION:**
Adjust the shims for each injection pump of four cylinders at the same time.

**Note:**
If the shim is thickened by 0.1 mm (0.0039 in), the injection timing is delayed for approx. 0.6 degree, and if thinned by 0.1 mm (0.0039 in), put forward for approx. 0.6 degree.

7. Assemble removed delivery valve to the injection pump after cleaning, and tighten the delivery holder to the specified torque.

**Tightening torque:**
39.2 — 44.1 N·m (4.0 — 4.5 kgf·m/28.9 — 32.5 lb·ft)

**CAUTION:**
Be careful with dirt getting inside when removing and installing the delivery valve or spring.

8. Install the injection pipe to the injection pump and the nozzle holder, and tighten it with the sleeve nut.
   a. Screw the thread portion of the sleeve nut two or three turns by your hand.
   b. Hold the delivery valve holder of the injection pump with a wrench and tighten the sleeve nut securely.

**Tightening torque:**
14.7 — 24.5 N·m (1.5 — 2.5 kgf·m/10.8 — 18.1 lb·ft)

**Important:**
If over-tightening the delivery valve holder, the rack cannot move smoothly as the plunger and the housing are compressed. Therefore, when tightening the sleeve nuts of the injection pipe, hold the delivery valve holder with a wrench to prevent corotation.
Inspection of compression pressure

1. Warm-up the engine.
2. Disconnect the battery cable from the negative terminal and remove all the glow plugs.
3. Disconnect the wire connector of the solenoid for engine stopping.
4. Install the battery cable to the negative terminal.
5. Install an adapter and a gauge of a compression gauge (special tool).

**Special tool**
Compression gauge (with adapter)
5-8840-2675-0
Adapter
5-8840-9029-0

6. Turn the starter until the indicator of compression gauge becomes stable and measure the compression pressure.

<table>
<thead>
<tr>
<th>Compression pressure (250 rpm)</th>
<th>MPa (psi)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Standard value</td>
<td>Service limit</td>
</tr>
<tr>
<td>3.04 (441)</td>
<td>2.5 (363)</td>
</tr>
</tbody>
</table>

**CAUTION:**
- Be sure to measure for all cylinders.
- Be sure to use the full-charged battery to maintain the engine speed of 250 rpm or more.

**Injection nozzle**
Use the nozzle tester to check the injecting condition.

**WARNING:**
Do not put hands close to the nozzle hole area when checking.
Diesel oil may permeate to your body and cause blood poisoning due to high pressure injection.
Injecting condition
Judge the nozzle condition by injecting condition.

Name
1. Good
2. Defective (fine or clogged)
3. Defective (dropping)

Note:
- Do not overhaul the engine as a two-step valve pressure nozzle is adapted to this engine.
- If a overhaul of the nozzle and inspection and adjustment of the injection pressure are required, contact a BOSCH service center.

Bleeding air from fuel system

In case of automatic air bleed system
Turn the starter switch to the drive position. The electromagnetic pump operates, the fuel is pressure-fed to the fuel pipe and the leak-off pipe, and the air in the fuel system is automatically bled out.

In case of other than automatic air bleed system
Bleed air from the fuel pipe eyebolt of the No.1 cylinder injection pump, the leak-off pipe eyebolt of the injection nozzle, and the air bleed plug of the fuel filter in the order from the part installed to lower portion, feeding the fuel by the electromagnetic pump, the gap with the fuel tank, the feed pump lever, etc.

Electromagnetic pump inspection procedure
1. Turn the key switch to ON, and check for pulsation in the fuel hose.
   • It is normal if pulsation exists.
2. Disconnect the electromagnetic pump connector, and connect 24 V power supply to the electromagnetic pump side to check if the pump operates.
   • If it operates properly, there may be open circuit, short circuit or poor contact in the machine-side harness. Repair the faulty part, and check again from Step 1.
   • If the electromagnetic pump does not operate, replace the pump.

Name
1. Injection pump
2. Electromagnetic Pump
3. + Terminal
4. - Terminal
3. Blow air into the inlet of the electromagnetic pump with your mouth.
   - The internal seal may be stuck. Blow air to eliminate sticking.

   ![Diagram of fuel inlet and outlet ports]

   **Name**
   1. Fuel Inlet Port
   2. Fuel Outlet Port

4. Install the removed parts, and check again from Step 1.

**Fan belt**

**Tension inspection**

Push between the fan pulley and the generator pulley with your finger (about 98 N (22 lb)). If the deflection is out of the standard value, adjust the belt tension.

<table>
<thead>
<tr>
<th>Deflection</th>
<th>mm (in)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Standard value</td>
<td>Approx. 8 — 10 (0.315 — 0.394)</td>
</tr>
</tbody>
</table>

**Adjustment procedure**

1. Loosen the adjusting plate which fixes the generator, and the mounting bolt of the generator.
2. Adjust the adjusting bolt to the standard value and fix the generator at this position.
   Be sure to tighten the mounting bolts which you have loosened.

**Note:**

Recheck the tension of the belt after fixing the generator since the tension varies in some degree when the generator gets fixed.

**Tightening torque:**

- M8 bolt or nut: 18.6 — 28.4 N·m (1.9 — 2.9 kgf·m/13.7 — 20.9 lb·ft)
- M10 bolt or nut: 41.2 — 55.0 N·m (4.2 — 5.6 kgf·m/30.4 — 40.6 lb·ft)
Name
1. Nut
2. Adjusting Bolt
3. Mounting Bolt

Removal
1. Remove the cooling fan.
   • Remove the bolts, and remove the cooling fan and the spacer.

2. Loosen the mounting bolts of the generator and of the adjusting plate, loosen the belt tension, and remove the fan belt.
3. Remove the mounting bolts of the fan pulley, and remove the fan pulley from the water pump.
4. Remove the generator together with the adjusting plate.

5. Remove the generator bracket.
6. Remove the starter.

Installation
1. Install the starter to the flywheel housing and tighten to the specified torque.

   **Tightening torque:**
   
   93.2 — 113 N·m {9.5 — 11.5 kgf·m/68.7 — 83.3 lb·ft}

2. Install the generator bracket.

   **Tightening torque:**
   
   M8 bolt: 18.6 — 28.4 N·m {1.9 — 2.9 kgf·m/13.7 — 20.9 lb·ft}
   M10 bolt: 41.2 — 55.0 N·m {4.2 — 5.6 kgf·m/30.4 — 40.6 lb·ft}

3. Install the generator.
   a. Temporarily install and tighten the adjusting plate with the water pump.
   b. Install the lower side of the generator to the generator bracket and temporarily tighten the bolts and nuts.
   c. Install the mounting bolt to the upper part of the generator through the adjusting plate. (Temporarily tighten)
4LE1 Engine Mechanical 1A-15

1. Water Pump
2. Adjusting Plate
3. Generator

4. Install the fan pulley to the water pump and tighten two positions.
   **Tightening torque:**
   7.8 — 11.8 N·m (0.8 — 1.2 kgf·m/5.8 — 8.7 lb·ft)

5. Install the fan belt to each pulley.
6. Adjust the tension of the fan belt.
   Move the generator installation position outside, adjust the belt deflection to the specified value, and tighten the generator and the adjusting plate.

7. Install the cooling fan.
   - Assemble the spacer and install the cooling fan. Tighten this part to the torque according to the tightening torque specification table in this workshop manual. (Find the torque value (medium value — upper limit) depending on a screw size against the symbols on the bolt head.)

**Deflection**
(Push between the pulleys by 98 N (22 lb))

5. Water Pump
6. Injection Pump Housing Cover
7. Oil Level Gauge
8. Oil Cooler
9. Solenoid ASM
Name
1. Orifice Plate 4. EGR Cut Solenoid
2. Valve Case 5. EGR Cooler
3. EGR Cooler Outlet Pipe 6. PCV Valve
Name
1. Water Pump Outlet Pipe (Thermostat)  5. Starter
2. Exhaust Manifold  6. Water Drain Plug
3. Cylinder Head Cover  7. Generator
4. Air Inlet Pipe
Name
1. Injection Pump 6. Water Pump
2. Nozzle Holder 7. Fuel Filter
3. Injection Pipe 8. Oil Filter
5. Thermostat Housing
Name
1. Oil Filler Cap  
2. Cooling Fan  
3. Injection Pump

Removal
1. Disconnect the drain plug of the oil pan and drain the engine oil.
2. Loosen the water drain cock on the cylinder block to drain the coolant remaining in the engine.

Name
1. Drain Plug (Oil)  
2. Drain Cock (Coolant)
3. Remove the EGR cooler outlet pipe.

**Note:**
After removing the pipe, seal so that foreign matter does not enter.

4. Remove the connector of the EGR cut solenoid, and remove the orifice plate, the valve case and the EGR cut solenoid.

![Diagram](WSLE0333)

**Name**
1. EGR Cut Solenoid
2. Valve Case
3. Orifice Plate
4. EGR Cooler Outlet Pipe

5. Remove the EGR cooler water inlet hose and the outlet hose.
6. Remove the EGR cooler.

**Note:**
After removing the EGR cooler, seal so that foreign matter does not enter.

7. Remove the EGR cooler bracket from the cylinder head.

8. Remove the rear hanger from the EGR cooler bracket.

![Diagram](WSLE0334)

**Name**
1. EGR Cooler Water Inlet Hose
2. EGR Cooler
3. EGR Cooler Water Outlet Hose
4. Rear Hanger
5. EGR Cooler Bracket

9. Remove the EGR cooler inlet pipe.

**Note:**
After removing the pipe, seal so that foreign matter does not enter.

![Diagram](WSLE0335)

**Name**
1. EGR Cooler Inlet Pipe

10. Remove the PCV valve from the intake chamber.
11. Loosen the rubber hose and remove the rubber hose and the air inlet pipe from the intake chamber.
12. Remove the intake chamber from the cylinder head.

**Note:**
The model without EGR valve and the EGR cooler has a cover installed with the intake chamber. After removing the cover, seal the hole so that foreign matter does not enter.

13. Remove the mounting bolts (M6×1.0, 15 bolts) of the head cover, and remove the head cover together with the gasket from the cylinder head.
   - Remove the baffle plate from the cylinder head cover.

**Name**
1. Intake Chamber
2. Cover
3. Gasket

---

14. Remove the turbocharger oil feed pipe and the return pipe.
15. Remove the exhaust adapter from the turbocharger.
16. Remove the turbocharger ASM from the exhaust manifold.

**Name**
1. Turbocharger Oil Return Pipe
2. Turbocharger Oil Feed Pipe
3. Turbocharger
4. Exhaust Adapter
17. Remove the mounting bolts and nuts of the exhaust manifold, and remove the manifold and the gaskets.

**Note:**
The model without EGR valve and the EGR cooler has a cover installed with the exhaust manifold. After removing the cover, seal the hole so that foreign matter does not enter.

**Name**
1. Exhaust Manifold
2. Cover
3. Gasket

18. Disconnect the water outlet pipe and pull out the thermostat.
19. Remove the water pump from the cylinder head and the cylinder block. (M8: 5 bolts, 2 nuts)

**Note:**
The water pump is installed to both the cylinder head and the cylinder block.

20. Loosen the sleeve nuts on the nozzle holder side and on the injection pump side and remove the injection pipe.

**Important:**
If over-tightening the delivery valve holder, the rack cannot move smoothly as the plunger and the housing are compressed. Therefore, when loosening the sleeve nuts of the injection pipe, hold the delivery valve holder with a wrench to prevent corotation.

**CAUTION:**
Always put a cap to prevent dust from getting in the delivery valve holder and the nozzle holder.

21. Disconnect the leak-off pipe and remove the packing.

**CAUTION:**
Always put a cap to prevent dust from getting in the delivery valve holder and the nozzle holder.
22. Remove the eyebolt and disconnect the fuel pipe.

**CAUTION:**
Always put a cap to prevent dust from getting in the delivery valve holder and the nozzle holder.

Name
1. Injection Pipe
2. Nozzle Holder
3. Leak-off Pipe
4. Injection Pump
5. Fuel Pipe

23. Remove the solenoid ASM inserted in the back of the injection pump installation part of the cylinder block.

**Note:**
Take care when removing it since liquid gasket is used.

24. Remove the housing cover of the injection pump installation part.
Since the liquid gasket is applied to the mating surface of the cylinder body, insert a bolt to the hole for M8 × 1.25 thread on the cover to remove the housing cover.
Do not extract the two stud bolts since the sealant is attached to them.

**Note:**
Take care when removing it since liquid gasket is used.
25. Remove the injection pump.
   a. Align the hole of the fuel cut lever with the hole of
      the governor cover, and then insert a pin (φ6 mm
      0.236 in) to the hole to hold the fuel cut lever.

   b. Make sure that the pin groove of the control link
      is aligned with the center of the injection pump.

   CAUTION:
   If the pin groove of the control link is not aligned
   with the center of the injection pump, you may not
   remove the injection pump because the rack pin of
   the injection pump is stuck to the cylinder block.

   c. Remove the injection pump, and remove the
      shim inserted in the pump installation part.

   CAUTION:
   • Put the removed shim and the injection pump
     together, attach a tag with cylinder number, and
     check the thickness.
     The removed shim cannot be reused.
   • Do not extract the eight studs since the sealant
     is attached to them.
26. Remove the control link.
   Pull out the snap pin on the connecting part to the link plate of the governor assembled in the timing gear case.

   **Note:**
   Take care not to lose the snap pin.

   ![Diagram](WSLE0212)

   **Name**
   1. Control Link
   2. Link Plate (Governor)
   3. Snap Pin

27. Disconnect the oil cooler water outlet hose and the inlet hose.
28. Disconnect the water hose (between water pipe and water pump).

   ![Diagram](WSLE0337)

   **Name**
   1. Water Hose
   2. Oil Cooler Water Outlet Hose
   3. Oil Cooler Water Inlet Hose

29. Remove the water pipe from the rocker arm bracket.

   ![Diagram](WSLE0419)

   **Name**
   1. Water Pipe

30. Remove the plug, and remove the oil cooler cover from the oil cooler.
31. Remove the center bolt, and remove the oil cooler ASM from the cylinder block.

   ![Diagram](WSLE0213)

   **Name**
   1. Oil Cooler ASM
   2. Center Bolt
   3. Oil Cooler Cover
   4. Plug
   5. Packing

32. Pull out the oil level gauge.
Installation

1. Insert the oil level gauge.
2. Install the oil cooler ASM to the cylinder block.
   - Install the packing to the oil cooler ASM and the center bolt.
     **Tightening torque:**
     Center bolt: 24.5 — 34.3 N·m (2.5 — 3.5 kgf·m/18.1 — 25.3 lb·ft)
3. Install the oil cooler cover to the oil cooler.
   - Install the O-ring to the oil cooler cover.
     **Tightening torque:**
     24.5 — 34.3 N·m (2.5 — 3.5 kgf·m/18.1 — 25.3 lb·ft)
4. Install the water pipe to the rocker arm bracket.
   **Tightening torque:**
   18.6 — 28.4 N·m (1.9 — 2.9 kgf·m/13.7 — 20.9 lb·ft)
5. Install the water hose (between water pipe and water pump).
6. Install the oil cooler water outlet hose and the inlet hose with a white paint applied area in the oil cooler side.

Name

1. Water Pipe
2. Oil Cooler Water Outlet Hose
3. White Paint Applied Area
4. Oil Cooler Water Inlet Hose

7. Install the control link.
   a. Insert the control link from the back to the connecting hole of the injection pump of the cylinder block, align it with the guide pin in the connecting hole and assemble.
   b. Assemble the pin part of the control link to the link plate hole of the governor assembled in the timing gear case, and fix it with the snap pin.
8. Install the injection pump.
   a. Align the hole of the fuel cut lever with the hole of the governor cover, insert a pin (φ6 mm {0.236 in}) to the hole and get the lever upright. (Control link is positioned on the center.)

   **CAUTION:**
   If the control link is not positioned on the center, you may fold the link when installing the injection pump.

   b. Align the shim with each stud and the knock pin, check the thickness of the shim and install it. (Shim thickness; Refer to 1A-4, “Function Check, ISUZU Diesel Engine”)

   **CAUTION:**
   Install a new shim whose thickness is the same as one being removed when disassembling.

   c. Align the rack pin of the injection pump with the center position of the pump.
   d. Insert the injection pump along with the two studs, align the knock hole with the knock pin of the cylinder block, and assemble them.
   e. Make sure that the rack pin and the groove of the control link are aligned from the housing cover installation part of the cylinder block side, and tighten the injection pump.

   **Tightening torque:**
   18.6 — 28.4 N·m {1.9 — 2.9 kgf-m/13.7 — 20.9 lb·ft}
f. Remove the pin (Ø6 mm {0.236 in}) inserted into the fuel cut lever, and make sure that the fuel cut lever moves smoothly.

9. Install the injection pump housing cover.
   Apply the liquid gasket (TB1207C) to the housing cover and install it to the cylinder block on the injection pump side.

   **Tightening torque:**
   7.8 — 11.8 N·m {0.8 — 1.2 kgf·m/5.8 — 8.7 lb·ft}

**Note:**
- Remove the sealant attached to the housing cover installation part of the cylinder block with a packing scraper completely and degrease sufficiently.
- Apply approx. 4 mm (0.157 in) width of liquid gasket to the cover edge and approx. 2 mm (0.079 in) width of liquid gasket to the circumference of the bolt in the housing cover.

10. Install the solenoid ASM.
   a. Apply liquid gasket (TB1207C) to the installation surface (bit groove) of the solenoid for the engine stopping.

**Note:**
- Remove the sealant attached to the installation part of the solenoid and of the cylinder block with a packing scraper completely and degrease.
- Do not apply the liquid packing to the thread portion.
b. Insert the solenoid ASM from the back of the cylinder block (back of the No.4 injection pump rack) and tighten to the specified torque.

**Tightening torque:**
14.7 — 24.5 N·m {1.5 — 2.5 kgf·m/10.8 — 18.1 lb·ft}

12. Install the leak-off pipe to the nozzle holder and tighten to the specified torque.

**CAUTION:**
Hold the pipe by your hand to prevent it from rotating when tightening.

**Tightening torque:**
24.5 — 34.3 N·m {2.5 — 3.5 kgf·m/18.1 — 25.3 lb·ft}

13. Connect the fuel pipe and the leak-off pipe with the fuel hose and fix it with a clip.

14. Install the injection pipe to the injection pump and the nozzle holder, and tighten it with the sleeve nut.
   a. Screw the thread portion of the sleeve nut two or three turns by your hand.
   b. Hold the delivery valve holder of the injection pump with a wrench and tighten the sleeve nut securely.

**Tightening torque:**
14.7 — 24.5 N·m {1.5 — 2.5 kgf·m/10.8 — 18.1 lb·ft}

**Important:**
If over-tightening the delivery valve holder, the rack cannot move smoothly as the plunger and the housing are compressed. Therefore, when tightening the sleeve nuts of the injection pipe, hold the delivery valve holder with a wrench to prevent corotation.
15. Install the water pump ASM.
   • Install the water pump ASM and the gasket to the cylinder block and the cylinder head, and tighten it to the specified torque.

   **Tightening torque:**
   18.6 — 28.4 N·m (1.9 — 2.9 kgf·m/13.7 — 20.9 lb·ft)

16. Connect the water outlet pipe.
   a. Assemble the thermostat, install the packing and the water outlet pipe, and tighten it to the specified torque.

   **Tightening torque:**
   18.6 — 28.4 N·m (1.9 — 2.9 kgf·m/13.7 — 20.9 lb·ft)

17. Install the exhaust manifold to the cylinder head.
   • Insert the gasket and tighten to the specified torque.

   **Tightening torque:**
   18.6 — 28.4 N·m (1.9 — 2.9 kgf·m/13.7 — 20.9 lb·ft)

   • When removing the exhaust manifold cover, insert the gasket and tighten to the specified torque.

   **Tightening torque:**
   21.6 — 31.4 N·m (2.2 — 2.3 kgf·m/15.9 — 23.2 lb·ft)
18. Install the cylinder head cover.
   a. Apply the liquid gasket (TB1207B) to the position in the cylinder head cover shown in the figure, and install the baffle plate to the cylinder head cover.
   b. Install the gasket to the cylinder head cover.
   c. Install the cylinder head cover to the rocker arm bracket and tighten it to the specified torque.

   **Tightening torque:**
   \[7.8 - 11.8 \text{ N}\cdot\text{m} \quad (0.8 - 1.2 \text{ kgf}\cdot\text{m}/5.8 - 8.7 \text{ lb}\cdot\text{ft})\]

19. Install the intake chamber to the cylinder head cover.
   - Insert the gasket and tighten to the specified torque.

   **Tightening torque:**
   \[7.8 - 11.8 \text{ N}\cdot\text{m} \quad (0.8 - 1.2 \text{ kgf}\cdot\text{m}/5.8 - 8.7 \text{ lb}\cdot\text{ft})\]
• When removing the intake chamber cover, insert the gasket and tighten to the specified torque.

**Tightening torque:**
21.6 — 31.4 N·m (2.2 — 2.3 kgf·m/15.9 — 23.2 lb·ft)

20. Install the PCV valve.

21. Install the turbocharger ASM to the exhaust manifold.
  • Insert the gasket and tighten to the specified torque.

**Tightening torque:**
21.6 — 31.4 N·m (2.2 — 3.2 kgf·m/15.9 — 23.2 lb·ft)

22. Install the exhaust adapter to the turbocharger.
  • Insert the gasket and tighten to the specified torque.

**Tightening torque:**
21.6 — 31.4 N·m (2.2 — 3.2 kgf·m/15.9 — 23.2 lb·ft)

23. Install the turbocharger oil feed pipe.

**Tightening torque:**
Turbocharger side: 9.8 — 14.7 N·m (1.0 — 1.5 kgf·m/7.2 — 10.8 lb·ft)
Cylinder block side: 22.0 — 27.0 N·m (2.2 — 2.8 kgf·m/16.2 — 19.9 lb·ft)

24. Install the turbocharger oil return pipe.
  • Insert the gasket and tighten to the specified torque.

**Tightening torque:**
7.8 — 11.8 N·m (0.8 — 1.2 kgf·m/5.8 — 8.7 lb·ft)

25. Connect the air intake pipe to the intake chamber.

**Tightening torque:**
11.0 — 13.0 N·m (1.1 — 1.3 kgf·m/8.1 — 9.6 lb·ft)

26. Install the sensor cover to the intake chamber with a white paint applied area facing upward.

**Tightening torque:**
3.0 — 5.0 N·m (0.31 — 0.51 kgf·cm/26.6 — 44.3 lb·in)

27. Install the rubber hose, and tighten and fix the hose with rubber hose clips.
1. Intake Chamber
2. Gasket
3. Air Inlet Pipe
4. Cylinder Head Cover
5. Rubber Hose
6. Rubber Hose Clip

28. Install the EGR cooler inlet pipe to the exhaust manifold.
• Insert the gasket and temporarily tighten the bolts and nuts.

29. Install the EGR cooler bracket to the cylinder head and temporarily tighten the bolts.
30. Install the EGR cooler.
• Insert the gasket and temporarily tighten the bolts.

31. Install the orifice plate, the valve case and the EGR cut solenoid to the intake chamber.
• Install the orifice plate and the gasket with protruding section in the position shown in the figure.
• Install the connector of the EGR cut solenoid.

Note:
Always apply Loctite (#262) to the stud bolt tap end when removing (loosening) the stud bolt indicated with an arrow in the illustration or replacing the stud bolts.
32. Install the EGR cooler outlet pipe.
   • Insert the gasket and temporarily tighten the bolts and nuts.

33. Temporarily tighten the bolts and nuts to the specified torque according to the order given on the figure.

**Name**

1. Stud Bolt
2. Tap End

**Name**

1. EGR Cooler Outlet Pipe

**Tightening torque:**

1. 21.6 — 31.4 N·m (2.2 — 3.2 kgf·m/15.9 — 23.2 lb·ft)
2. 18.6 — 28.4 N·m (1.9 — 2.9 kgf·m/13.7 — 20.9 lb·ft)
34. Install the rear hanger.

**Tightening torque:**
18.6 — 28.4 N·m {1.9 — 2.9 kgf·m/13.7 — 20.9 lb·ft}

35. Install the EGR cooler water inlet hose with a white paint applied area in the cylinder block side.

36. Install the EGR cooler water outlet hose with a white paint applied area in the water return pipe side.

**Name**
1. EGR Cooler Water Inlet Hose
2. EGR Cooler Water Outlet Hose
3. White Paint Applied Area

37. Add coolant.

38. Add engine oil.

Rocker Arm Shaft

Components

Name
1. Rocker Arm Shaft
2. Lock Nut
3. Rocker Arm
4. Adjusting Screw
5. Rocker Arm Shaft Plug
6. Rocker Arm Bracket
7. Rocker Arm Shaft Pin
8. Rocker Arm Spring
Removal
1. Remove the EGR cooler.
   Refer to 1A-22, “Removal, Engine Exterior Equipment”.
2. Remove the cylinder head cover.
   Refer to 1A-22, “Removal, Engine Exterior Equipment”.
3. Remove the water pipe.
   Refer to 1A-22, “Removal, Engine Exterior Equipment”.
4. Remove the rocker arm bracket ASM.
   (M6 × 1.0: 5 bolts, 6 nuts)

Note:
Since liquid gasket is used on the mating surface to the cylinder head, be careful not to damage the rocker arm bracket when removing it.
* With screws for replacer (M8 × 1.25)

5. Pull out the eight push rods.

Disassembly
1. Remove plug of the rocker arm shaft.
2. Pull out the rocker arm shaft backward.

CAUTION:
When reinstalling the rocker arm, prepare tags written down the cylinder numbers and symbols to distinguish “intake” and “exhaust”, to avoid installing the improper position.

Inspection

Inspection of rocker arm and rocker arm shaft
Check for wear, damage, clogging of oil port and other abnormality.

Inspection for a bend of the rocker arm shaft
Hold the shaft on both ends with V block, and measure the runout of the center by the dial gauge. (The bend value should be a half of the runout.)

<table>

3. Bolt
### Inspection for wear of the rocker arm shaft
Measure the outside diameter of the shaft at sliding portions (eight points) in the rocker arm.

<table>
<thead>
<tr>
<th>Nominal dimension</th>
<th>Service limit</th>
<th>Repairing procedure</th>
</tr>
</thead>
<tbody>
<tr>
<td>φ12 (0.472)</td>
<td>φ11.85 (0.467)</td>
<td>Replace.</td>
</tr>
</tbody>
</table>

### Inspection of clearance between the rocker arm and the rocker arm shaft
Measure the bushing bore and calculate the clearance between the arm and the outside diameter of the shaft.

<table>
<thead>
<tr>
<th>Clearance between the arm and the shaft</th>
<th>mm (in)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Standard value</td>
<td></td>
</tr>
<tr>
<td>0.005 — 0.045</td>

</tr>
<tr>
<td>0.2 (0.008)</td>
<td>Replace the rocker arm or the shaft.</td>
</tr>
</tbody>
</table>
Inspection of rocker arm
Check the contact surface of the valve stem of the rocker arm for stepped wear or damage.
If the stepped wear (1) and damage (2) of the contact surface are slight, repair with the oil stone.
If the stepped wear and damage are extreme, replace the rocker arm.

Visual check of push rod
Replace with new one if there is excessive wear or damage.

Inspection for a bend of the push rod
Rotating the push rod on a surface plate, measure the bend with the thickness gauge.
If the measured value exceeds the limit, replace with new one.

<table>
<thead>
<tr>
<th>Push rod bend</th>
<th>mm (in)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Service limit</td>
<td>0.3 (0.012) or less</td>

</tbody>
</table>

Reassembly
1. Clean the rocker arm shaft and the oil port of the rocker arm by air.
2. Apply the engine oil to the rocker arm shaft and the rocker arm sliding portion.
3. Install the rocker arm shaft and the rocker arm.
   When positioning the rocker arm shaft, align the rocker shaft pin inserted to the rocker arm bracket with the cutout of the rocker arm shaft.

Note:
When reinstalling the rocker arm, be sure to check the tag and install to the original position.
4. Install the plug of the rocker arm.

**Installation**

1. Put the push rod through the cylinder block and insert it to the tappet.
2. Align it with a groove on the bottom of the rocker arm bracket and apply liquid gasket (TB1207B).

**Note:**
Do not apply the liquid gasket to a groove around the oil gallery.

**Applied width of sealant**

3. Contact the rocker arm to the rocker spring, rotate the crank, and set the No.1 cylinder to the exhaust top dead center.
4. Install the rocker arm bracket ASM along with the stud bolt of the cylinder head, and tighten it to the specified torque.

**Tightening torque:**

7.8 — 11.8 N-m {0.8 — 1.2 kgf-m/5.8 — 8.7 lb-ft}

**Note:**
- Remove paint and sealant attached to the top of the cylinder head and the bottom of the rocker arm bracket with a PKG scraper etc., and degrease sufficiently.
- Assemble it to the cylinder head within 5 minutes after applying the sealant.
- When assembling, align the saucer part of the push rod and the rocker arm adjusting screw.
Name
1. Rocker Arm Bracket
2. Nut
3. Bolt

5. Adjustment of valve clearance
   Refer to 1A-4, “Function Check, ISUZU Diesel Engine”.

6. Install the water pipe.
   Refer to 1A-29, “Installation, Engine Exterior Equipment”.

7. Install the cylinder head cover.
   Refer to 1A-29, “Installation, Engine Exterior Equipment”.

8. Install the EGR cooler.
   Refer to 1A-29, “Installation, Engine Exterior Equipment”.

Removal
1. Remove the cooling fan.
   Refer to 1A-14, “Removal, Engine Accessories”.
2. Remove the fan belt.
   Refer to 1A-14, “Removal, Engine Accessories”.
3. Remove the fan pulley.
   Refer to 1A-14, “Removal, Engine Accessories”.
4. Remove the generator.
   Refer to 1A-14, “Removal, Engine Accessories”.
5. Remove the EGR cooler and the bracket.
   Refer to 1A-14, “Removal, Engine Accessories”.
6. Remove the cylinder head cover.
   Refer to 1A-22, “Removal, Engine Exterior Equipment”.
7. Remove the turbocharger.
   Refer to 1A-22, “Removal, Engine Exterior Equipment”.
8. Remove the water pump.
   Refer to 1A-22, “Removal, Engine Exterior Equipment”.
9. Remove the injection pipe.
   Refer to 1A-22, “Removal, Engine Exterior Equipment”.
10. Remove the leak-off pipe.
    Refer to 1A-22, “Removal, Engine Exterior Equipment”.
11. Remove the rocker arm bracket.
    Refer to 1A-41, “Removal, Rocker Arm Shaft”.
12. Remove the front hanger.

**Name**

1. Cylinder Head ASM  
2. Head Bolt (M12)  
3. Head Gasket  
4. Front Hanger  
5. Head Bolt (M8)

13. Gradually loosen the cylinder head bolts at an equal balanced rate from outside toward the center as the order indicated in the diagram. (M12: 10 bolts, M8: 5 bolts)

**Disassembly**

1. Remove the exhaust manifold.  
   Refer to 1A-22, "Removal, Engine Exterior Equipment".

2. Remove the connector, glow plug and nozzle holder ASM before disassembling the valve system.

3. Compress the valve spring to remove the split collar, spring seat, valve spring and valve.  
   **Special tool**  
   Valve spring remover  
   5-8840-9030-0

   **CAUTION:**
   - Disassemble the cylinder head ASM on the flat wood to prevent part damage.
   - When removing the nozzle holder ASM, take great care not to damage the nozzle tip.

4. Remove the valve seal.
   - Use pliers to remove the valve seal.

14. Remove the cylinder head ASM and the head gasket.

15. Pull out the tappet from the cylinder block.
5. Remove the valve guide.
   • Use a valve guide installer to pull out the valve guides from the bottom of the cylinder head.
   **Special tool**
   Valve guide installer
   5-8840-9035-0

---

**Inspection**

**Inspection of cylinder head**

Remove any carbon attached to the bottom of the head, taking care not to damage the valve seat surface. Check each part for damage and perform the color check as required.

Water leakage: Water pressure test 490 kPa (71 psi) (for three minutes)

---

**Inspection of bottom distortion**

Place a straightedge on the four side-directions and the two diagonal directions, and measure the distortion with the thickness gauge. (Refer to the diagram.)

Name

1. Cylinder Head
2. Valve Seat Insert
3. Valve
4. Cylinder Head Lower Surface
Repair of valve seat

1. Remove any carbon attached to the valve seat surface. Use a seat cutter (15°, 45°, 75°) to cut off scratches and hollows at minimum until they disappear, and adjust the contact width to the standard value.

2. Grind them after repair.

Replacement of valve seat insert

If the depression level of the seat exceeds the limit, replace the valve seat insert.

1. Arc-weld the entire inside diameter of the valve seat insert.

2. Cool the valve seat insert for two to three minutes. It contracts as it cools down, making it easier to remove the valve seat insert.

3. Remove the valve seat insert, using a screwdriver. Be sure not to hurt the cylinder head.

4. Clean off carbon and metallic oxides on the insert bore of the cylinder head.

5. Use a smooth pad and press-fit with a press. (9.8 — 14.7 kN (2,203 — 3,305 lb))

6. Apply compound to the valve seat surface, grind them while rotating the valve, and make sure that it contacts evenly over the circumference.

CAUTION:
After grinding, remove compound completely.
**Inspection for wear of the valve stem**

Measure the outside diameter at position as shown in the figure. Repair light stepped wear with the oil stone. If the measured value is below the service limit, replace the valve guide and the valve as a set.

<table>
<thead>
<tr>
<th>Nominal dimension</th>

</tr>
</tbody>
</table>

**Inspection of valve guide**

**Note:**
If there is a scratch or abnormal abrasion on the valve stem and the inside diameter part of the valve guide, replace the valve and valve guide together.

1. Measure the valve guide clearance.
   - Measure the clearance between the valve guide and valve stem within 10 mm (0.39 in) from the valve guide, using a dial gauge.
   - If the measured value exceeds the limit, replace the valve guide and valve altogether.

<table>
<thead>

<td></td>
</tr>
</tbody>
</table>

Height from the upper surface of the cylinder head to the edge surface of the valve guide: 9.5 mm (0.374 in)
2. Install the valve seal.
   a. When press-fitting, apply engine oil sufficiently over the outer circle of the valve guide.
   b. Beat until the oil seal protruding section is securely held to the valve guide groove. Also, check that the spring does not come off.

**Special tool**
Valve seal setting tool
5-8840-9033-0

**CAUTION:**
Take care to avoid damaging the lip of the seal.

3. Install the valve.
   - Apply the mixture of the oil and Bellmoly Paste (molybdenum disulfide) to the valve stem part.
   - Engine oil : molybdenum = 1:1

**CAUTION:**
Be sure to prevent the valve from coming off and causing dents after installing the valve.

**Name**
1. Valve Guide
2. Groove
3. Protruding Section

**Name**
1. Valve Stem
4. Install the valve spring and the spring seat. Install the valve spring with its narrow pitched side (white paint side) facing downward.

5. Install the split collar. Use the tool (remover) to compress the spring and insert the split collar securely.

   **Special tool**
   Valve spring remover 5-8840-9030-0

6. Install the nozzle holder ASM.
   a. Check the injection condition and injection pressure of the injection nozzle, and perform service before assembly. (Refer to 1A-4, “Function Check, ISUZU Diesel Engine”)
   b. Install the gasket to the cylinder head.
   c. Install the nozzle holder ASM and tighten to the specified torque.

   **Tightening torque:**
   39.2 — 49.0 N·m (4.0 — 5.0 kgf·m/28.9 — 36.1 lb·ft)

   **CAUTION:**
   • Be sure to prevent the nozzle holder tip from adhering of dirt and from damaging.
   • Use new gasket.

7. Install the exhaust manifold. Assemble the stamp mark (or seal) side of the gasket facing the manifold.

   **Tightening torque:**
   18.6 — 28.4 N·m (1.9 — 2.9 kgf·m/13.7 — 20.9 lb·ft)
8. Assemble the glow plug to the cylinder head and tighten to the specified torque.

**Tightening torque:**
20.0 — 25.0 N⋅m (2.0 — 2.5 kgf⋅m/14.8 — 18.4 lb⋅ft)

9. Install the connector to the glow plug and tighten to the specified torque.

**Tightening torque:**
0.9 — 1.1 N⋅m (0.09 — 0.11 kgf⋅m/0.7 — 0.8 lb⋅ft)

**Name**
1. Glow Plug
2. Connector

**Installation**
1. Assemble the tappet to the cylinder block. (Check the assemble position marked at the disassembling.)
2. Install the head gasket. Install the head gasket with the stamped mark facing upward.

3. Install the cylinder head ASM gently on the gasket.
4. Apply engine oil to the threads and the seating surfaces of the head bolts, and tighten them from the center part to the outside bolts symmetrically in the numerical order shown in the illustration.

**Tightening torque:**
M12: 83.4 — 93.2 N⋅m (8.5 — 9.5 kgf⋅m/61.5 — 68.7 lb⋅ft) → 60° — 90°
M8: 24.5 — 34.3 N⋅m (2.5 — 3.5 kgf⋅m/18.1 — 25.3 lb⋅ft)
5. Install the rocker arm bracket.
   Refer to 1A-44, “Installation, Rocker Arm Shaft”.

6. Install the front hanger and tighten to the specified torque.

   **Tightening torque:**
   18.6 — 28.4 N·m (1.9 — 2.9 kgf·m/13.7 — 20.9 lb·ft)

---

7. Install the leak-off pipe.
   Refer to 1A-29, “Installation, Engine Exterior Equipment”.

8. Install the injection pipe.
   Refer to 1A-29, “Installation, Engine Exterior Equipment”.

9. Install the water pump.
   Refer to 1A-29, “Installation, Engine Exterior Equipment”.

10. Install the turbocharger.
    Refer to 1A-29, “Installation, Engine Exterior Equipment”.

11. Install the cylinder head cover.
    Refer to 1A-29, “Installation, Engine Exterior Equipment”.

12. Install the EGR cooler and the bracket.
    Refer to 1A-29, “Installation, Engine Exterior Equipment”.

13. Install the generator.
    Refer to 1A-14, “Installation, Engine Accessories”.

    Refer to 1A-14, “Installation, Engine Accessories”.

15. Install the fan belt.
    Refer to 1A-14, “Installation, Engine Accessories”.

16. Install the cooling fan.
    Refer to 1A-14, “Installation, Engine Accessories”.

Removal
1. Remove the cylinder head cover.
   Refer to 1A-22, “Removal, Engine Exterior Equipment”.
2. Remove the rocker arm bracket.
   Refer to 1A-41, “Removal, Rocker Arm Shaft”.
3. Remove the cylinder head ASM.
   Refer to 1A-47, “Removal, Cylinder Head”.

WSLE0053
4. Remove the mounting bolts and nuts of the oil pan, and then remove the oil pan from the cylinder block. (M6: 18 bolts, 4 nuts)

5. Remove the oil strainer mounting bolts from the bearing cap, and remove the oil strainer from the oil pump.

6. Loosen the sleeve nut and remove the oil pipe (between the oil pump and the cylinder block).

7. Remove the piston and the connecting rod.
   a. Rotate the crank and bring the removed piston to the bottom dead center.
   b. Loosen the cap nut of the connecting rod and remove the cap.
   c. Further rotate the crank and bring the piston to the top dead center.
   d. Put a handle of a hammer or something on the bottom of the connecting rod, and push the piston ASM upward from the inside of the cylinder block.

**CAUTION:**
- Remove any carbon attached to the inner wall of the cylinder using a scraper before removing the piston.
- Be careful not to damage the inner wall of the cylinder when pushing out the piston ASM.
- Attach tags with each cylinder number to the removed cap and the bearing and arrange them.
Disassembly

1. Use the piston ring setting tool (tool commercially available is also acceptable) to remove the piston ring.

Special tool
Piston ring setting tool
1-8522-1029-0

CAUTION:
Piston ring deforms if it is expanded beyond the limit.

2. Remove the piston pin.
   a. Use a commercial tool to remove the snap ring.
   b. Put a brass stick on the piston pin and gently tap by a hammer to knock it out.

CAUTION:
Put the piston, piston ring, piston pin, connecting rod, and so on in order according to the cylinder number.

Name
1. Piston Pin
2. Brass Stick

Inspection

Axial play of the connecting rod and the crank pin

Measure an axial play before removing the connecting rod.

1. Pull the connecting rod all the way to the front.
2. Insert a thickness gauge to the clearance between the connecting rod cap and the crankshaft, and then measure a play.

<table>
<thead>

Inspection of clearance with the cylinder bore

1. Measure the outside diameter of the piston at the specified distance from top surface in the right-angle direction to the piston pin.
   Measurement position of outside diameter: 54.85 mm {2.159 in} from the top surface.
1A-62 4LE1 Engine Mechanical

2. Calculate the clearance by the dimension of the cylinder bore and the outside diameter dimension of the piston.

**Inspection for wear of the piston pin (outside diameter)**

Use a micrometer to measure the outside diameter of the piston pin. If the measured value exceeds the limit, replace the piston pin.

**Inspection of piston ring end gap**

Insert the ring to the cylinder bore and push it with the piston head so that the ring makes a right angle with the cylinder, then measure.
Inspection of clearance between the piston ring groove and the ring

1. Remove any carbon sludge from the piston ring groove.
   Using the old piston ring helps you to remove the carbon easily.
2. Measure the clearance between the piston ring and the ring groove using a thickness gauge at several points.
   If the measured value exceeds the limit, replace the piston ring or the piston.

CAUTION: When replacing the piston, replace the piston ring also at the same time.

CAUTION: When replacing the piston, replace the piston ring also at the same time.

Connection of distortion and parallelism of the connecting rod

Use a connecting rod aligner to measure it.
Connecting rod small end diameter (φ27 mm (1.063 in))

Clearance between the bearing and the crank pin

1. Tighten the bearing cap to the specified torque. Then measure the inside diameter.

   **Tightening torque:**
   - Connecting rod small end diameter (27 mm (1.063 in)): 23 — 26 N·m (2.3 — 2.7 kgf·m/17.0 — 19.2 lb·ft) → 100° — 115°
   - Connecting rod small end diameter (25 mm (0.9843 in)): 73.5 — 83.4 N·m (7.5 — 8.5 kgf·m/54.2 — 61.5 lb·ft)

2. Measure the outside diameter of the after-mentioned crankshaft pin, and calculate the clearance.
Cylinder and piston combination
The pistons are selected by the grade when assembled at the factory. However, the grades are not set to the standard pistons for service.

<table>

</tbody>
</table>

Reassembly
1. Assemble pistons and connecting rods.
   a. It is advisable to warm the piston at a temperature of approx. 100°C (212°F) with a piston heater. However, the piston is able to be assembled when it is cold.
   b. Apply engine oil sufficiently to the piston pin.
   c. Assemble the connecting rod with the cylinder number stamped side facing the piston combustion chamber direction, and push in the piston pin.
      At this time, check that the front mark on the piston head and the casting mark (ISUZU) on the connecting rod are in the same direction.

2. Install the snap ring.
   Insert the snap ring and fix it with the piston pin. Check to see the piston and connecting rod move smoothly.
3. Install the piston ring.
   Use the piston ring setting tool to install the piston ring.

   **Special tool**
   Piston ring setting tool
   1-8522-1029-0

   a. Install the oil ring so that the end of the ring is in the opposite direction of 180° to that of the coil expander.

   **Note:**
   For the coil expander, make sure that there is no gap in the joint.

   b. Install the compression rings with T, 1T or 2T mark facing upward in the order of the second and top compression rings.

   **CAUTION:**
   The shapes of the top and second compression rings are different.

   **Installation**
   1. Before inserting the piston ASM to the cylinder, set the piston ring end as shown in the illustration, avoiding the side-pressure direction (the right-angle direction to the piston pin).

   **Name**
   1. Top Ring
   2. Second Ring
   3. Oil Ring

   2. Bring the crankshaft to the top dead center position.

   3. Install the bearing to the connecting rod and the bearing cap.
4. Apply engine oil to the inside of the bearing, the piston ring, the ring groove and the side surface of the piston, and the inside of the cylinder. Then push the piston in the cylinder bore with the front mark on it facing forward. Also, check that the connecting rod alignment number (cylinder number) is facing to the injection pump side.

**Special tool**
Piston ring compressor
5-8840-9018-0

5. Install the connecting rod cap.
   a. Rotate the crank slowly to the bottom dead center position.
      At this time, push in the piston ASM as it follows the crank.
   b. Apply engine oil to the bearing and crank pin, and install aligning the marking numbers of the connecting rod and the bearing cap.
   c. Apply engine oil to the threads and the seating surface of the connecting rod.

**Tightening torque:**
Connecting rod small end diameter (\(\phi 27 \text{ mm} \{1.063 \text{ in}\})\): 23 — 26 N·m \(\{2.3 — 2.7 \text{ kgf·m/17.0 — 19.2 \text{ lb·ft}\}\) → 100° — 115°
Connecting rod small end diameter (\(\phi 25 \text{ mm} \{0.9843 \text{ in}\})\): 73.5 — 83.4 N·m \(\{7.5 — 8.5 \text{ kgf·m/54.2 — 61.5 \text{ lb·ft}\}\)

**Note:**
Check that the crankshaft turns smoothly after assembly of the connecting rod.

6. Install the oil pipe (between the oil pump and the cylinder block) and tighten the sleeve nut.

**Tightening torque:**
24.5 — 34.3 N·m \(\{2.5 — 3.5 \text{ kgf·m/18.1 — 25.3 \text{ lb·ft}\}\}

7. Install the oil strainer to the oil pump and tighten the strainer bracket to No.2 bearing cap.

**Tightening torque:**
18.6 — 28.4 N·m \(\{1.9 — 2.9 \text{ kgf·m/13.7 — 20.9 \text{ lb·ft}\}\}

**Name**
1. Oil Pipe
2. Oil Strainer
3. To No.2 Bearing Cap
8. Install the oil pan.
   a. Install the oil pan and the packing to the cylinder block and tighten the bolts evenly. 

   **Tightening torque:**
   $7.8 - 11.8 \text{ N} \cdot \text{m} \ (0.8 - 1.2 \text{ kgf} \cdot \text{m}) / 5.8 - 8.7 \text{ lb} \cdot \text{ft}

   b. Install the drain plug.

   **Tightening torque:**
   $68.6 - 88.2 \text{ N} \cdot \text{m} \ (7.0 - 9.0 \text{ kgf} \cdot \text{m}) / 50.6 - 65.1 \text{ lb} \cdot \text{ft}

---

Name
1. Oil Pan
2. Drain Plug

9. Install the cylinder head ASM.
   Refer to 1A-56, “Installation, Cylinder Head”.

10. Install the rocker arm bracket.
    Refer to 1A-44, “Installation, Rocker Arm Shaft”.

11. Install the cylinder head cover.
    Refer to 1A-29, “Installation, Engine Exterior Equipment”.
Torque Specifications

N·m (kg·m / lb·ft)

Connecting rod small end (Ø27mm (1.063in))
- 23 - 26 (2.3 - 2.7 / 17.0 - 19.2) → 100° - 115°

Connecting rod small end (Ø25mm (0.9843in))
- 73.5 - 83.4 (7.5 - 8.5 / 54.2 - 61.5)
**Components**

1. **Flywheel**

**Removal**

1. Remove the flywheel.
   a. Block the crankshaft from rotating, and loosen the mounting bolts in the order indicated in the diagram to remove the flywheel.
   b. Put alignment marks before removing the flywheel from the crankshaft. (Doing so makes installing easy because the positions of the mounting bolts are fixed even if pitch of them is not equal.)
   c. Gently tap the flywheel by a plastic hammer or similar tool to remove it.

**CAUTION:**
Be careful not to damage the ring gear.
2. Take out the ring gear.
   Put a brass stick on the ring gear and strike with a hammer to remove it.

Installation

1. Install the ring gear.
   Heat the ring gear evenly using a gas burner and strike with a hammer to install it.
   After shrinkage fit, make sure that the ring gear is stuck to the flywheel.

CAUTION:
Do not heat the ring gear at a temperatures above 200°C (392°F).

2. Install the flywheel.
   Apply engine oil to the threads and the seating surface of the mounting bolts, and then install the flywheel to the crankshaft.
   Tighten the mounting bolts in a balanced way in the numerical order shown in the illustration.

   **Tightening torque:**
   88.3 — 108 N·m (9.0 — 11.0 kgf·m/65.1 — 79.7 lb·ft)

**Note:**
Install the flywheel checking the installation position since the bolt hole pitch is not equal.
Torque Specifications

88.3 - 108 (9.0 - 11.0 / 65.1 - 79.7 N·m (kg·m / lb·ft)
Crankshaft Front Oil Seal

Removal

1. Remove the cooling fan and the fan belt. Refer to 1A-14, “Removal, Engine Accessories”.
2. Remove the fan pulley. Refer to 1A-14, “Removal, Engine Accessories”.
3. Remove the generator. Refer to 1A-14, “Removal, Engine Accessories”.
4. Remove the generator bracket. Refer to 1A-14, “Removal, Engine Accessories”.
5. Remove the injection pipe. Refer to 1A-22, “Removal, Engine Exterior Equipment”.
6. Remove the fuel pipe. Refer to 1A-22, “Removal, Engine Exterior Equipment”.
7. Remove the solenoid ASM. Refer to 1A-22, “Removal, Engine Exterior Equipment”.
8. Remove the injection pump housing cover. Refer to 1A-22, “Removal, Engine Exterior Equipment”.
9. Remove the injection pump. Refer to 1A-22, “Removal, Engine Exterior Equipment”.
10. Remove the control link. Refer to 1A-22, “Removal, Engine Exterior Equipment”.
11. Remove the oil pan. Refer to 1A-59, “Removal, Piston, Connecting Rod”.
12. Remove the crank pulley.
   a. Block the crankshaft from rotating, and loosen the mounting bolts of the pulley to remove it.
   b. Remove the washer and the pulley.

**CAUTION:**
Do not reuse the bolt and washer.
13. Remove the timing gear case.
   a. Before removing the timing gear case, make sure that control link supported by the cylinder block and the link plate of the governor are separated. If they are connected, remove the snap pin and separate them.

b. The timing gear case should be removed with the governor and the front oil seal.

Note:
Since liquid gasket is applied to the mating surface to the cylinder block, take great care not to remove them forcibly to damage or deform them.

14. Remove the front oil seal from the timing gear case.
   • Remove the oil seal with a screwdriver avoiding damage to the oil seal contact surface on the timing gear case.
Inspection

Inspection of oil seal
If fault is found in the lip section of the oil seal, replace it with the new one.

Name
1. Timing Gear Case
2. Front Oil Seal

Installation
1. Install the front oil seal.
   a. Apply enough engine oil to the felt section of the oil seal.
   b. Install the front oil seal to the timing gear case with a front oil seal installer.
      Install it at the position due to the L dimension shown in the illustration.

Special tool
Front oil seal installer
5-8840-9031-0

Name
1. Front Oil Seal
2. Timing Gear Case

2. Install the timing gear case (with governor) to the cylinder block.
   a. Let the link plate of the governor which is assembled in the gear case through the connection hole of the injection pump.
   b. Apply engine oil to the both ends of the bushing section of the governor main spring lever.
   c. Apply the liquid gasket (TB1207B) to the gear case and install to the cylinder block.

   Tightening torque:
   18.6 — 28.4 N·m {1.9 — 2.9 kgf·m/13.7 — 20.9 lb·ft}

   d. Assemble the packing and the governor cover to the top of the gear case and tighten them to the specified torque.

   Tightening torque:
   7.8 — 11.8 N·m {0.8 — 1.2 kgf·m/5.8 — 8.7 lb·ft}

Note:
Apply enough engine oil to the main and dust lip section of the front oil seal before installing.
3. Install the crank pulley.
   a. Install the crank pulley to the crankshaft.
   b. Block the crankshaft from rotating, assemble the washer, and tighten it with the mounting bolts.

**CAUTION:**
Replace the bolt and washer with new ones.

**Tightening torque:**
167 — 186 N·m (17.0 — 19.0 kgf·m/123.2 — 137.2 lb·ft)

4. Install the oil pan.
   Refer to 1A-67, “Installation, Piston, Connecting Rod”.

5. Install the control link.
   Refer to 1A-29, “Installation, Engine Exterior Equipment”.

6. Install the injection pump.
   Refer to 1A-29, “Installation, Engine Exterior Equipment”.

7. Install the injection pump housing cover.
   Refer to 1A-29, “Installation, Engine Exterior Equipment”.

8. Install the solenoid ASM.
   Refer to 1A-29, “Installation, Engine Exterior Equipment”.

9. Install the fuel pipe.
   Refer to 1A-29, “Installation, Engine Exterior Equipment”.

10. Install the injection pipe.
    Refer to 1A-29, “Installation, Engine Exterior Equipment”.

11. Install the generator bracket.
    Refer to 1A-14, “Installation, Engine Accessories”.

12. Install the generator.
    Refer to 1A-14, “Installation, Engine Accessories”.

13. Install the fan pulley.
    Refer to 1A-14, “Installation, Engine Accessories”.

14. Install the cooling fan and the fan belt.
    Refer to 1A-14, “Installation, Engine Accessories”.

Removal

1. Remove the starter.
   Refer to 1A-14, “Removal, Engine Accessories”.
2. Remove the flywheel.
   Refer to 1A-71, “Removal, Flywheel”.
3. Remove the flywheel housing.
   a. Remove the mounting bolt to the cylinder block.
   b. Gently tap the housing by a plastic hammer or similar tool to remove it from the cylinder block.
4. Remove the retainer.
   Remove the retainer with the rear oil seal from the
   back of the cylinder block.

**CAUTION:**
Since liquid gasket is applied, be careful not to
remove it forcedly to damage or deform it.

5. Remove the rear oil seal from the retainer.
   • Remove the oil seal with a screwdriver avoiding
damage to the oil seal contact surface on the
   retainer.

**Installation**
1. Install the rear oil seal to the retainer with a rear oil
   seal installer.

   **Special tool**
   Rear oil seal installer
   5-8840-9032-0

   2. Install the retainer.
   Apply a thin coat of engine oil to the lip section of
   the oil seal and install the retainer. (Apply the liquid
gasket TB1207B)

   **CAUTION:**
   Be sure to prevent the big end of the crankshaft
   from adhering of dust or foreign materials.

   The tightening order of the retainer is as shown in
   the illustration and you should tighten it to the fol-
   lowing torque.

   **Tightening torque:**
   7.8 — 11.8 N·m {0.8 — 1.2 kgf·m/5.8 — 8.7 lb·ft}
3. Install the flywheel housing to the cylinder block.

6. Remove the fuel pipe. Refer to 1A-22, “Removal, Engine Exterior Equipment”.
7. Remove the solenoid ASM. Refer to 1A-22, “Removal, Engine Exterior Equipment”.
8. Remove the injection pump housing cover. Refer to 1A-22, “Removal, Engine Exterior Equipment”.
9. Remove the injection pump. Refer to 1A-22, “Removal, Engine Exterior Equipment”.
10. Remove the control link. Refer to 1A-22, “Removal, Engine Exterior Equipment”.
11. Remove the oil pan. Refer to 1A-59, “Removal, Piston, Connecting Rod”.
12. Remove the crank pulley. Refer to 1A-74, “Removal, Crankshaft Front Oil Seal”.
13. Remove the timing gear case. Refer to 1A-74, “Removal, Crankshaft Front Oil Seal”.
14. Remove the idle gear and the idle gear shaft.
Inspection

Inspection of backlash of the timing gear
Before removing the timing gear, measure backlash of it.

1. Put a dial gauge on the tooth of the measured gear.
2. Move the gear right and left lightly, and read the deflection of the dial gauge.
   If it exceeds the limit, replace the timing gear.

<table>
<thead>
<tr>
<th>Backlash of the timing gear</th>
<th>mm (in)</th>
</tr>
</thead>
<tbody>
<tr>

<td>0.2 (0.008)</td>
</tr>
</tbody>
</table>

Inspection of idle gear and gear shaft
1. If there is excessive wear or damage on the sliding surface of the idle gear and the gear shaft, and on the inside of the idle gear bushing, replace either the shaft or the gear.
2. If there is stepped wear or something on the idle gear and the thrust collar, replace either the idle gear or the thrust collar.

Inspection of uneven wear of the idle gear shaft
Measure the outside diameter of the idle gear shaft using a micrometer, and calculate the amount of uneven wear.
Inspection of clearance between the idle gear bushing and the shaft

Measure the idle gear bushing bore and calculate the clearance between the bushing and the outside diameter of the idle gear shaft.

<table>

</tr>
</tbody>
</table>

Installation

1. Install the idle gear.
   a. Install the idle gear shaft to the cylinder block. (The position where the oil hole is located obliquely upward)
   b. Apply engine oil to the bushing surface and the tooth surface of the idle gear, and the idle gear shaft. Then assemble the idle gear with its timing points (black dots) facing the forward direction and aligning the timing points (black dots) of the camshaft gear and the crank gear at the same time.
   c. Apply engine oil to the thrust collar sliding surface and the threads and the seating surfaces of the bolts. Then install to the idle gear with the chamfered side of the collar facing the outside, and tighten it with the bolts.

   **Tightening torque:**
   20.6 — 30.4 N·m {2.1 — 3.1 kgf·m/15.2 — 22.4 lb·ft}

   **CAUTION:**
   Assemble the idle gear shaft aligning the positioning pin with the knock hole.
2. Install the timing gear case.
   Refer to 1A-76, “Installation, Crankshaft Front Oil Seal”.
3. Install the crank pulley.
   Refer to 1A-76, “Installation, Crankshaft Front Oil Seal”.
4. Install the oil pan.
   Refer to 1A-67, “Installation, Piston, Connecting Rod”.
5. Install the control link.
   Refer to 1A-29, “Installation, Engine Exterior Equipment”.
6. Install the injection pump.
   Refer to 1A-29, “Installation, Engine Exterior Equipment”.
7. Install the injection pump housing cover.
   Refer to 1A-29, “Installation, Engine Exterior Equipment”.
8. Install the solenoid ASM.
   Refer to 1A-29, “Installation, Engine Exterior Equipment”.
9. Install the fuel pipe.
   Refer to 1A-29, “Installation, Engine Exterior Equipment”.
10. Install the injection pipe.
    Refer to 1A-29, “Installation, Engine Exterior Equipment”.
11. Install the generator bracket.
    Refer to 1A-14, “Installation, Engine Accessories”.
12. Install the generator.
    Refer to 1A-14, “Installation, Engine Accessories”.
13. Install the fan pulley.
    Refer to 1A-14, “Installation, Engine Accessories”.
14. Install the cooling fan and the fan belt.
    Refer to 1A-14, “Installation, Engine Accessories”.

Removal

1. Remove the EGR cooler and the bracket. Refer to 1A-22, “Removal, Engine Exterior Equipment”.
2. Remove the cylinder head cover. Refer to 1A-22, “Removal, Engine Exterior Equipment”.
3. Remove the rocker arm bracket. Refer to 1A-41, “Removal, Rocker Arm Shaft”.
4. Remove the cylinder head. Refer to 1A-47, “Removal, Cylinder Head”.
5. Remove the tappet. Refer to 1A-47, “Removal, Cylinder Head”.
6. Remove the timing gear case. Refer to 1A-74, “Removal, Crankshaft Front Oil Seal”.
7. Remove the camshaft gear.
   a. Pull out the sleeve from the end of the camshaft.
   b. Remove the lock nut from the camshaft gear, and remove the flyweight ASM and the camshaft gear.
8. Remove the camshaft.
   a. Remove the snap ring which holds the front bearing of the camshaft from the ring groove of the cylinder block.
   b. Pull out the camshaft with the bearing from the cylinder block.
Name
1. Camshaft
2. Snap Ring

Inspection
Inspection of camshaft
Check the journal portion and the cam portion for wear, damage, and other abnormality.

CAUTION:
The ball bearings are fitted to the front and rear parts of the camshaft. Also, the roller bearing is press-fitted to the cylinder block at the center part. Check that each bearing has no rattle and rotates smoothly with this condition.

### Inspection of journal and cam

#### 1. Height of the cam (A – B)

<table>
<thead>
<tr>
<th></th>
<th>Standard value</th>
<th>Service limit</th>
<th>Repairing procedure</th>
</tr>
</thead>
<tbody>
<tr>
<td>Inlet</td>
<td>6.13 (0.241)</td>
<td>5.83 (0.230)</td>
<td>Replace.</td>
</tr>
<tr>
<td>Exhaust</td>
<td>6.43 (0.253)</td>
<td>6.13 (0.241)</td>
<td></td>
</tr>
</tbody>
</table>

#### 2. Center journal diameter (the dimensions in X – X and Y – Y directions)

<table>
<thead>
<tr>
<th>Nominal dimension</th>
<th>Service limit</th>
<th>Repairing procedure</th>
</tr>
</thead>
<tbody>
<tr>
<td>φ52 (2.047)</td>
<td>φ51.92 (2.044)</td>
<td>Replace.</td>
</tr>
</tbody>
</table>

#### 3. Uneven wear of the journal (the difference between the measurements in X – X and Y – Y directions)

<table>
<thead>
<tr>
<th>Nominal dimension</th>
<th>Service limit</th>
<th>Repairing procedure</th>
</tr>
</thead>
<tbody>
<tr>
<td>φ52 (2.047)</td>
<td>0.05 (0.002)</td>
<td>Replace.</td>
</tr>
</tbody>
</table>
**Inspection of camshaft runout**

1. Put the camshaft on the V block.
2. Place the dial gauge to the center journal part.
3. Rotate the camshaft once and read the deflection of the indicator.
   If the measured value exceeds the limit, replace the camshaft.

<table>
<thead>
<tr>
<th>Name</th>
<th>mm (in)</th>
<th>Service limit</th>
<th>Repairing procedure</th>
</tr>
</thead>
<tbody>
<tr>
<td>0.02 (0.0008) or less</td>
<td>0.1 (0.0039)</td>
<td>Replace.</td>
<td></td>
</tr>
</tbody>
</table>

**Inspection of tappet**

Check the contact surface with the camshaft.
If there is pitching, defective contact, vermiculation, or crack, replace the tappet.

**Inspection for wear of the tappet outside diameter**

Use a micrometer to measure the outside diameter of the tappet.
If the measured value exceeds the limit, replace the tappet.

<table>
<thead>
<tr>
<th>Outside diameter of the tappet</th>
<th>mm (in)</th>
<th>Standard value</th>
<th>Service limit</th>
</tr>
</thead>
<tbody>
<tr>
<td>φ20.97 — 20.98 (0.8256 — 0.8260)</td>
<td>20.92 (0.8240)</td>
<td>Replace.</td>
<td></td>
</tr>
</tbody>
</table>
Inspection of clearance between the tappet and the cylinder block

Use the bore gauge to measure the bore diameter of the tappet insertion hole on the cylinder block and calculate the clearance.

<table>
<thead>
<tr>
<th>Clearance between the tappet and the cylinder block hole</th>
<th>Standard value</th>
<th>Service limit</th>
</tr>
</thead>
<tbody>
<tr>

</tr>
<tr>
<td></td>
<td>(0.0008 — 0.0021)</td>
<td></td>
</tr>
</tbody>
</table>

Installation

1. Install the camshaft ASM.
   a. Apply engine oil to the camshaft journal, bearing, cam surface, and the inside of the cylinder block bearing. Then assemble the camshaft ASM.

   **CAUTION:**
   Be careful not to damage the bearing when assembling.

   b. Install the snap ring to the outside of the front bearing, and check that the camshaft rotates smoothly.

2. Install the camshaft gear and the sleeve.
   a. Install the camshaft gear to the camshaft with its timing point (black dot) facing the forward direction.

   b. Assemble the flyweight, apply engine oil to the thread and the seating surface of the lock nut, and tighten.

   **Tightening torque:**
   68.6 — 88 N·m {6.99 — 8.97 kgf·m/50.5 — 64.9 lb·ft}

   c. Apply engine oil to the sleeve shaft and the sliding surface of the flyweight.

   d. Insert the sleeve collar section to the concave portion of the flyweight. Then insert the sleeve shaft to the end of the camshaft.

   **Note:**
   Check that the sleeve moves smoothly.
3. Install the timing gear case.  
   Refer to 1A-76, “Installation, Crankshaft Front Oil Seal”.  
4. Install the tappet.  
   Refer to 1A-56, “Installation, Cylinder Head”.  
5. Install the cylinder head.  
   Refer to 1A-56, “Installation, Cylinder Head”.  
6. Install the rocker arm bracket.  
   Refer to 1A-44, “Installation, Rocker Arm Shaft”.  
7. Install the cylinder head cover.  
   Refer to 1A-29, “Installation, Engine Exterior Equipment”.

3. Crankshaft

Removal
1. Remove the engine accessories.
   Refer to 1A-14, “Removal, Engine Accessories”.
2. Remove the engine exterior equipment.
   Refer to 1A-22, “Removal, Engine Exterior Equipment”.
3. Remove the rocker arm bracket.
   Refer to 1A-41, “Removal, Rocker Arm Shaft”.
4. Remove the cylinder head.
   Refer to 1A-47, “Removal, Cylinder Head”.
5. Remove the piston and the connecting rod.
   Refer to 1A-59, “Removal, Piston, Connecting Rod”.
6. Remove the flywheel.
   Refer to 1A-71, “Removal, Flywheel”.
7. Remove the crankshaft front oil seal.
   Refer to 1A-74, “Removal, Crankshaft Front Oil Seal”.
8. Remove the crankshaft rear oil seal.
   Refer to 1A-79, “Removal, Crankshaft Rear Oil Seal”.
9. Remove the idle gear.
   Refer to 1A-82, “Removal, Timing Gear Train”.
10. Remove the camshaft.
    Refer to 1A-87, “Removal, Camshaft”.
11. Remove the oil pump ASM from the cylinder block.

Disassembly
1. Remove the gear from the crankshaft.

Inspection

Inspection of axial play of the crankshaft
Measure an axial play before removing the crankshaft.
1. Pull the crankshaft all the way to the front.
2. Insert the thickness gauge to the front side of No.2 journal portion of the crankshaft (thrust bearing installation part) and measure the play. If the measured value exceeds the limit, replace the thrust bearing.

<table>
<thead>
<tr>
<th>Axial play of crankshaft (mm)</th>
<th>Standard value</th>
<th>Service limit</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>0.058 - 0.208</td>
<td>0.3 (0.012)</td>
</tr>
</tbody>
</table>

CAUTION:
Attach tags with each cylinder number to the removed cylinder parts to identify installation positions, and put them in order.

Inspection of crankshaft
Check for wear, damage, clogging of oil port and other abnormality.

Inspection of outside diameter of the crankshaft journal
Measure the outside diameter of the crankshaft journal, and calculate the amount of wear and uneven wear. If it exceeds the limit, replace the crankshaft.
1. Nominal dimension

<table>
<thead>
<tr>
<th>Journal</th>

### Inspection of clearance between the journal and the bearing

Tighten the bearing cap to the specified torque and measure the inside diameter of the bearing to calculate the clearance.

**Tightening torque:**

83.4 — 93.2 N·m (8.5 — 9.5 kgf·m/61.5 — 68.7 lb·ft)

<table>
<thead>
<tr>
<th>Clearance between the journal and the bearing</th>

<td>0.11 {0.0043}</td>
</tr>
</tbody>
</table>
Inspection of tension of the journal main bearing
Check whether the tension of the bearing is sufficient.

<table>
<thead>
<tr>
<th>mm (in)</th>
<th>Standard value</th>
<th>Service limit</th>
<th>Repairing procedure</th>
</tr>
</thead>
<tbody>
<tr>
<td>W = 64.5 — 65.5 (2.539 — 2.579)</td>
<td>D = 64 (2.520)</td>
<td>L = 0.02 — 0.06 (0.0008 — 0.00236)</td>
<td>W = 64.1 (2.524)</td>
</tr>
</tbody>
</table>

Repairing procedure: use the one with extrusion and tension, and be careful about sticking of the rear side.

Standard for the bearing tension (reference)

Name
1. Tension (Free Condition)
2. Extrusion
Reassembly
1. Install the crankshaft gear.
   Put a brass stick on the gear and strike with a hammer to install.

Installation
1. Install the crankshaft upper bearing.
   a. While there are the oil holes and oil grooves on the upper bearing (block side), there is none on the lower bearing (bearing cap side). Take care when assembling.
   
   **CAUTION:**
   If assembling the lower bearing and upper bearing inversely, seizure occurs in the crankshaft bearing. Be careful with it.

   b. Wipe the rear side of the crankshaft bearing and the inside of the crank bearing housing of the cylinder block, and check that there is no foreign matter.
   
   c. Assemble the pawl of the bearing to the cutout portion of the cylinder block securely, and apply engine oil sufficiently to the inside of the bearing (sliding surface).

2. Install the crankshaft.
   Put the crankshaft on the cylinder block carefully.

3. Install the crankshaft lower bearing.
   Assemble the thrust bearing with the oil groove facing outward. (No.2 journal portion)

   **CAUTION:**
   • Be sure to prevent the installation position and sliding surface of the bearing from adhering of dirt.
   • Be sure to prevent the backside of the bearing (installation position) from adhering of oil.

Name
1. Upper Bearing
2. Lower Bearing
3. Thrust Bearing
4. Crankshaft
5. Upper Bearing Pawl
6. Lower Bearing Pawl
4. Install the crankshaft bearing cap.
   a. Install the bearings to each bearing cap and apply engine oil sufficiently. Then assemble them from the front so that the arrow marks on the caps facing toward the front of the engine in the order of the marking numbers.
   b. Apply engine oil to the threads and the seating surface of the bearing cap bolt. Then tighten evenly in several batches in the order shown in the illustration, and at the end, tighten to the specified torque.

   **Tightening torque:**
   \[ 83.4 - 93.2 \text{ N} \cdot \text{m} \ (8.5 - 9.5 \text{ kgf} \cdot \text{m/61.5 - 68.7 lb} \cdot \text{ft}) \]
   c. After assembling, check that the crankshaft rotates.

5. Install the oil pump ASM.
   a. Pour engine oil to the oil pipe and installation port of the oil strainer.
   b. Install the oil pump ASM to the cylinder block.

   **Tightening torque:**
   \[ 18.6 - 28.4 \text{ N} \cdot \text{m} \ (1.9 - 2.9 \text{ kgf} \cdot \text{m/13.7 - 20.9 lb} \cdot \text{ft}) \]

6. Install the camshaft.
   Refer to 1A-90, “Installation, Camshaft”.
7. Install the idle gear.
   Refer to 1A-84, “Installation, Timing Gear Train”.
8. Install the crankshaft rear oil seal.
   Refer to 1A-80, “Installation, Crankshaft Rear Oil Seal”.
9. Install the crankshaft front oil seal.
   Refer to 1A-76, “Installation, Crankshaft Front Oil Seal”.
10. Install the flywheel.
    Refer to 1A-72, “Installation, Flywheel”.
11. Install the pistons and connecting rods.
    Refer to 1A-67, “Installation, Piston, Connecting Rod”.
12. Install the cylinder head.
    Refer to 1A-56, “Installation, Cylinder Head”.
13. Install the rocker arm bracket.
    Refer to 1A-44, “Installation, Rocker Arm Shaft”.
14. Install the engine exterior equipment.
    Refer to 1A-29, “Installation, Engine Exterior Equipment”.
15. Install the engine accessories.
    Refer to 1A-14, “Installation, Engine Accessories”.

Removal
1. Remove the engine accessories. Refer to 1A-14, "Removal, Engine Accessories".
2. Remove the engine exterior equipment. Refer to 1A-22, "Removal, Engine Exterior Equipment".
3. Remove the rocker arm bracket. Refer to 1A-41, "Removal, Rocker Arm Shaft".
4. Remove the cylinder head. Refer to 1A-47, "Removal, Cylinder Head".
5. Remove the piston and the connecting rod. Refer to 1A-59, "Removal, Piston, Connecting Rod".
6. Remove the flywheel. Refer to 1A-71, "Removal, Flywheel".
7. Remove the crankshaft front oil seal. Refer to 1A-74, "Removal, Crankshaft Front Oil Seal".
8. Remove the crankshaft rear oil seal. Refer to 1A-79, "Removal, Crankshaft Rear Oil Seal".
9. Remove the idle gear. Refer to 1A-82, "Removal, Timing Gear Train".
10. Remove the camshaft. Refer to 1A-87, "Removal, Camshaft".
11. Remove the crankshaft. Refer to 1A-92, "Removal, Crankshaft".
Inspection

Inspection of cylinder block
Check the cylinder block for wear, damage, water leakage and other abnormality.

1. Use a wooden plug or something to block the water passage and check for leakage.
   Water leakage: Water pressure test 490 kPa (71 psi) (for three minutes)
2. Check for damage by the color check.
3. Check the jet hole of the piston cooling and water hole between bores for clogging or something abnormal.

Inspection of cylinder bore
Measure the cylinder bore at specified positions with a cylinder gauge.
Measurement position: 13 mm (0.512 in) lower from the top surface.
(Measure in the X – X and Y – Y directions.)
(Near top ring)

CAUTION:
- Oversized piston and piston ring are set to 0.25 mm (0.0098 in).
- Be sure to perform honing after boring.
  Honing should be at 0 to 0.03 mm (0 to 0.0012 in) against oversize diameter. Difference of each cylinder bore should be 0.02 mm (0.0008 in) or less.

Cylinder bore diameter and grade mark
Grade mark is stamped to each installation surface of the injection pump of the cylinder block.

<table>

Cooling System

Service Precautions

WARNING:
Do not remove the radiator cap when the cooling water is at high temperature. Steam or boiling water will gush out and you may be burnt. To open the radiator cap, cover the cap with a thick cloth when the cooling water is cool, release the pressure by slowly turning the cap, and then remove the cap.

Explanations on Functions and Operation

Cooling water system
The cooling water system, which is the forced circulation system, consists of a water pump, thermostat, and radiator as its main components.

Name
1. Thermostat (Bottom Bypass type)
2. Oil Cooler
3. EGR Cooler
4. Cylinder Head
5. Cylinder Block
6. Water Pump
7. Radiator
8. Bypass Circuit

WSLE0172
Water Pump

The water pump, which uses the centrifugal impeller system, is driven by the engine fan belt.

Name

1. Fan Center
2. Impeller
3. Seal Unit
4. Bearing Unit
**Thermostat**

The thermostat, which is a wax pellet type, has an valve initial opening temperature of $82 \pm 1.5 ^\circ C \{180 \pm 34.7 ^\circ F\}$. 

**Name**

1. Valve  
2. Piston  
3. Jiggle Valve

**Function Check**

**Cooling water level check**

- Check the cooling water level within the reserve tank and the level is appropriate when the cooling water level is within the MAX (upper limit) and MIN (lower limit) range. In case the volume of the cooling water is deficient, remove the reserve tank cap and replenish the tank with a mixture of tap water (soft water), distilled water or demineralized water and antifreeze in the ratio of 1:1 until the level comes close to the MAX line.

**Cooling water leak check**

- Use the radiator cap tester and apply a pressure of 200 kPa {29.0 psi} and check for leaks in the locations given below. Check that the radiator hose and heater hose are not damaged or degraded and the hose clamp is not loose.

**Inspection location**

- Radiator ASM, water pump ASM, radiator hose, heater hose

**Coolant**

**1. About the engine coolant concentration**

- Take the concentration corresponding to the minimum temperature because the freezing temperature varies according to the concentration of the engine coolant.  
- Use only Isuzu genuine engine coolant.  
- Use engine coolant with a mix ratio in the range of 30 to 60% because over heating is likely to occur if the ratio is greater than 60% and corrosion prevention is inadequate if the ratio is less than 30%.

**Standard value**

| Cooling water level (engine only) | 4.2 L {3.7 qts} (with EGR) | 2.8 L {3.0 qts} (without EGR) |

**Cooling water leak check**

- Use the radiator cap tester and apply a pressure of 200 kPa {29.0 psi} and check for leaks in the locations given below. Check that the radiator hose and heater hose are not damaged or degraded and the hose clamp is not loose.

**Inspection location**

- Radiator ASM, water pump ASM, radiator hose, heater hose

**Graph**

- Antifreeze concentration (%) vs. Freezing temperature (°C)
2. Engine coolant concentration measurement

Methods for measuring specific gravity

- Measure the specific gravity and the temperature of the cooling water using an antifreeze hydrometer and thermometer. Take precautionary measures as the boiled cooling water may gush out at high temperatures if the cap is removed.
- Use a deep container to suit the height of the specific gravity meter.

<table>
<thead>
<tr>
<th>Freezing temperature guideline</th>
<th>Maximum mix ratio L (qts)</th>
<th>Concentration of engine coolant</th>
</tr>
</thead>
<tbody>
<tr>
<td>Engine coolant</td>
<td>Tap water</td>
<td></td>
</tr>
<tr>
<td>-18°C (−0.4°F)</td>
<td>4.2 (4.4)</td>
<td>7.8 (8.2)</td>
</tr>
<tr>
<td>-25°C (−13°F)</td>
<td>5.0 (5.3)</td>
<td>7.0 (7.4)</td>
</tr>
<tr>
<td>-35°C (−31°F)</td>
<td>6.0 (6.3)</td>
<td>6.0 (6.3)</td>
</tr>
<tr>
<td>-40°C (−40°F)</td>
<td>6.4 (6.8)</td>
<td>5.6 (5.9)</td>
</tr>
</tbody>
</table>

• Fix the temperature of the cooling water being measured in the range of 0 to 50°C (32 to 122°F).
• Measure the temperature and specific gravity and determine the concentration from the table given below.

Name

1. Antifreeze Hydrometer
2. Radiator
Coolant scope method

- Measure the concentration using the coolant scope.

EGR cooler air bleeding procedure

When replacing the coolant, bleed air from the EGR cooler with the following procedure.

**Note:**

Be sure to replace the coolant when it is cooled.

1. Loosen the air bleed plug (1) on the EGR cooler.

2. Pour coolant into the radiator via its opening.

3. Tighten the plug when the coolant spills over from the air bleed plug.

**CAUTION:**

If loosening the air bleed plug, be sure to replace the copper packing with new one.

**Note:**

- Take care to prevent the spilt coolant from getting the exhaust system parts wet.
- Be sure to wipe off the spilt coolant.

**Tightening torque:**

24.5 — 30.5 N·m (2.5 — 3.1 kgf·m/18.1 — 22.5 lb·ft)

4. Pour coolant into the radiator via its opening again until it is filled.

5. After filling the radiator, idle the engine for approx. 5 minutes. Air in the cooler comes off and the coolant level is lowered, then stop the engine. After the engine is cooled, check the radiator and the reserve tank coolant levels. If they are low, replenish the coolant.
Water Pump

Components

Inspection

Appearance check
- Check for cracks or damage in the pump body.
- Check for cracks and corrosion in the impeller.
- Check for water leakage from the seal unit.
- If you find abnormalities, replace the water pump ASM.

Inspection of bearing rattle

<table>
<thead>
<tr>
<th>Rattle of the water pump ball bearing</th>

</tr>
</thead>
<tbody>
<tr>
<td>Standard value</td>
<td>Service limit</td>
</tr>
<tr>
<td>0.008 — 0.010 (0.00031 — 0.00040)</td>
<td>0.2 (0.008)</td>
</tr>
</tbody>
</table>

Inspection of the bearing rattle

- Rotate the fan center while pushing it along the radial direction. Confirm that there is no abnormal noise and no excessive play.
- If you find abnormalities, replace the water pump ASM.

Name
1. Water Pump
Thermostat

**Inspection**
Replace it if there is wear, damage, or other abnormality.

Fuel System

Service Precautions

Parts of the fuel system such as the internal part of the nozzle holder, holes and clearances that form passages for fuel are finished to a very high degree of accuracy. They are therefore highly sensitive to foreign matter and the entry of foreign matter could cause damage to the fuel passage. Take extreme care not to allow foreign matter to enter.

If water removal agent is used in the fuel then it will absorb moisture in the light oil and may cause rust. Therefore, do not use water removal agent in the fuel tank.

When servicing the fuel system, every precaution must be taken to prevent the entry of foreign material into the system.

- Before beginning the service procedure, wash the fuel line and the surrounding area.
- Perform the service procedures with clean hands. Do not wear work gloves.
- Immediately after removing the fuel hose and/or fuel pipe, carefully tape vinyl bags over the exposed ends of the hose or pipe.
- If parts are to be replaced (fuel hose, fuel pipe, etc.), do not open the new part packaging until installation.

Discard gaskets and O-rings and replace them with new ones.

Work procedure

- The fuel opening must be quickly sealed when removing the fuel pipe, injection pipe, nozzle holder, and injection pump.
- The eyebolts and gasket must be stored in a clean parts box with a lid to prevent adhesion of foreign matter.
- Fuel leakage could cause fires. Therefore, after finishing the work, wipe off the fuel that has leaked out and make sure there is no fuel leakage after starting the engine.
Explanations on Functions and Operation

Fuel system diagram

Name
1. Fuel Tank
2. Sedimenter
3. Fuel Filter
4. Injection Pump
5. Nozzle Holder
6. Nozzle

Note:
• Be careful foreign material does not enter into the fuel system, because the precise fuel system is used.
1. Rack Pin

**Injection pump**

**Nozzle holder**

*Note:*

If a overhaul of the nozzle and inspection and adjustment of the injection pressure are required, contact a BOSCH service center.

1. Nozzle
CAUTION:
As the cartridge holds the fuel, take care not to dirty around the system when removing it. Also, take care of fire.

1. Rotate the water sedimenter lever until it stops with its handle right above the supporting point (close) to shut out the fuel flow.
2. Loosen the ring nut to remove the cup and take out the element inside of the sedimenter.
3. Clean the cup and the element and install the new packing in the ring nut.
4. Securely tighten the cup holding the element to the body with the ring nut.
5. After installing, rotate the water sedimenter lever until it stops with its handle right below the supporting point (open) to make the fuel flow.

Engine cannot be started or operated as the fuel is shut out while the water sedimenter lever handle is turned to the right above the supporting point.
Service Precautions

1. Engine performance test is required for adjustment of the governor-related parts.
2. Measure the dimensions of A and B in the structure diagram (1) before disassembling, and set them to the same dimensions when reassembling.
3. When you cannot carry out a performance test after reassembling, do not disassemble it.
4. Apply engine oil to each sliding portion (the lever end surface, the shaft hole and the outer circumference of the shaft) when reassembling it.
5. Install the set spring securely to a groove of the pin connecting the floating lever, taking care of the assembly direction.
6. Before installing the start spring, make sure that each lever moves by its weight.
7. After installing the start spring, make sure that each lever moves smoothly. Also, make sure that each spring operates normally.

Disassembly

Disassembly of the governor lever-related components
1. Remove the levers and spring from the timing gear case.

Disassembly of the full load stopper
1. Remove the full load stopper from the timing gear case.

Disassembly of the governor cover
1. Remove the fuel cut lever and the idle spring-related components from the governor lever.

Disassembly of the shifter
1. Remove the snap ring and the shaft to remove the shifter from the guide lever.

Disassembly of the control lever-related components
1. Remove the nut to remove the control lever.
2. Take off the hook on the return spring from the projection of the lever (main spring) and pin.
3. Remove the bushing.
4. Remove the return spring.
5. Remove the lever (main spring).
Reassembly of the control lever-related components

1. Put the lever (main spring) through lever holes of the timing gear case.

CAUTION:
Put both axes of the lever through lever holes alternately before assembling the bushings.

2. Put the return spring of the control lever through a axis of the lever (main spring).
3. Assemble the bushing.

Assemble the bushing of the lever (main spring), and then assemble the bushing of the control lever.

CAUTION:
Apply Loctite (No.601) to the outer circle of the bushing when assembling the bushing.

4. Assemble the hooks on both ends of the return spring (control lever) to the protrusion of the lever (main spring)
and pin securely.
5. Assemble the control lever.

After installing the O-ring to a groove of the bushing (control lever), assemble the washer and the control lever, and tighten the nut.

Tightening torque:
11.8 — 17.7 N.m (1.2 — 1.8 kgf-m/8.7 — 13.1 lb-ft)
Name
1. Bushing
2. Groove
3. O-ring
4. Washer
5. Control Lever
6. Spring Washer
7. Nut

CAUTION:
• When tightening the control lever, fix the control lever.
  (Fix the lever of the main spring. Do not over-tighten it.)
• After assembling, make sure that the control lever moves smoothly.

Reassembly of the shifter
1. Assemble the shifter to the guide lever, put the shaft through it, and assemble the snap ring.
2. Make sure that the shaft rotates smoothly.
3. Make sure that the shifter moves smoothly.

Name
1. Guide Lever
2. Shifter
3. Snap Ring
4. Shaft
Reassembly of the governor cover

Assemble the fuel cut lever and the idle spring-related components to the governor cover.

Name
1. Folding Part
2. Governor Cover
3. Return Spring
4. Thrust Washer
5. Stop
6. Driving
7. Governor Cover
8. Idle Spring
9. Nut
10. Spring Washer
11. Fuel Cut Lever
12. O-ring
13. Cutout Groove
14. Shaft

1. Apply engine oil to the sliding surface of the governor cover when assembling the shaft.
2. Assemble the both ends of the return spring to the cutout groove on the bottom of the cover and the folding part of the lever securely.
3. After assembling, make sure that it moves smoothly.
4. When assembling the governor cover to the timing gear case, temporarily tighten it with dimension A in the diagram 2 — 3 mm (0.079 — 0.118 in). Assemble B part after the performance set.

<table>
<thead>
<tr>
<th>Dimension A (When temporarily assembling)</th>
<th>mm (in)</th>
</tr>
</thead>
<tbody>
<tr>
<td>2 — 3</td>
<td>0.079 — 0.118</td>
</tr>
</tbody>
</table>
Reassembly of the full load stopper

Install the full load stopper to the timing gear case, and temporarily tighten the nut.
Reassembly of the governor lever-related components

Assemble each lever and the spring to the timing gear case.

**Name**

Charging System

General Description
The main charging system components are the batteries, the generator and the battery charge indicator light circuit. The generator is a self-rectifying type with a built-in regulator.

Name
1. Nut
2. Sliding Piece
3. Generator Adjusting Plate
4. Adjusting Nut
5. Tension Adjusting Bolt
6. Generator
7. Lower Mounting Bolt
Maintenance
The most common indication of charging system troubles is an undercharged or overcharged battery. Since the battery itself may be defective, check the battery first. Check if the battery is discharged because of short circuit, or electrical components left turned on for extended periods.

Keep the generator and all other electrical system terminals clean and tight. A loose or badly corroded terminal connection will create excessive resistance in the circuit and result in hard starting, dim lights, etc.

Inspect the generator system at regular intervals and correct any potential causes of trouble before machine performance is affected.

Diagnosis of charging system
Trouble in the charging system will be evidenced as one or more of the following three conditions:
1. The battery charge warning lamp will stay on.
2. An undercharged battery as evidenced by slow cranking.
3. An overcharge, or overvoltage, condition.

Undercharged battery
Inspection
1. Accessories were not left turned on for extended periods.
2. Drive belt for proper tension.
3. The ECM main relay has been stuck ON with the key switch in OFF position. (Battery voltage is consumed.)
4. Wiring and connections for corrosion or looseness.

Overcharge (or Overvoltage) condition
A charging rate in excess of 29.5 volts (24V model) / 15 volts (12V model) for a prolonged period may cause early electrical system failure. Blown fuses, light bulbs burned out, and even battery failure may result. If this condition exists, test the generator as described under “Generator Output Test” later in this section.

Noisy generator
Inspection
1. Drive pulley for looseness.
3. Bearings for dirt, damage, or wear.
   Generator noise may also be caused by the loose belt, core touch, or worn or damaged diodes and/or starter.

Electrical tests
Before performing the following generator electrical tests on the vehicle, be certain that the system wiring is not defective and generator belts are not slipping. Also, the battery must be fully charged for a valid test of the charging system.

Note:
To avoid damage to the vehicle electrical system, always observe the following precautions:
- Do not polarize the generator.
- Do not short across or ground any of the terminals in the charging circuit.
- Never operate the generator with the output terminal open-circuited.
- Be sure the generator and battery have the same ground polarity.
- When connecting a charger or other battery to the machine’s battery, connect negative to negative and positive to positive.

1. With the engine control switch “ON” and engine not running, connect a voltmeter from terminal “E” to ground. The voltmeter should show 0 volts.
2. With the engine control switch “ON” and engine not running, connect a voltmeter from terminal “B” to ground. The voltmeter should show 24 volts (24V model) / 12 volts (12V model) or more.
3. With the engine control switch “ON” and the engine not running, connect a voltmeter from white wire side of the connector to ground. The voltmeter should show 24 volts (24V model) / 12 volts (12V model) or more.
4. With the engine control switch “ON” and the engine not running, the “charge” light should be on. This shows that the current is running into the initiating excitation circuit to the generator.
5. With the engine running and the headlight high beams (if equipped) turned on, read the voltage at the “B” post on the generator. The voltmeter should show 24 volts (24V model) / 12 volts (12V model) or more.
6. If steps 1 through 4 are not OK, check connectors in the harness for looseness or corrosion and retest.
7. If step 5 voltage is low, substitute a known good regulator and test again. If the voltage is still low, bench test the generator.
Generator (12V-50A Hitachi, Ltd.)

Structure

![Diagram of Generator Structure]

- STATOR COIL
- ROTOR COIL
- IC REGULATOR
- CONDENSER
- DIODE
Removal

- Battery ground cable
1. Electrical wiring at the generator.
2. Loosen the adjusting nut.
3. Loosen the ACG adjusting bolt.
4. Loosen the lower mounting bolt.
   - Loosen the lower mounting bolt while holding the nut located on the back using a tool.
5. Drive belt.
6. Generator.

Installation

1. Generator.
   - Tighten the lower mounting bolt while holding the nut located on the back using a tool.
2. ACG adjusting bolt.
3. Adjusting nut.
4. Electrical wiring at the generator.
   - Battery ground cable
   - Install wiring (AV5.0 mm², black) from the negative terminal of the generator to the engine ground and connect it to ground securely.

Performance Test
In the performance test of generator, connect as follows and measure the regulated voltage and output current.
Actual wiring diagram for performance test of IC regulator built-in generator

Regulated voltage measurement of regulator

Close SW1 switch, and raise the generator speed to approximately 5000 rpm. If a voltmeter shows between 14.1 and 14.7 V, the regulated voltage of regulator is normal.
Replace the regulator if the voltmeter shows out of range between 14.1 and 14.7 V.

Specified value of regulated voltage

<table>
<thead>
<tr>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>14.1 — 14.7 V (+20°C {68°F})</td>
</tr>
</tbody>
</table>

Speed of generating 13.5 V

Close SW1 switch and gradually raise the generator speed until a voltmeter shows 13.5 V, then measure the speed.
Judge as normal if the current speed is 1,000 rpm or less.

Measurement of the output current

Close SW1 and SW2 switches and raise the generator speed to 5,000 rpm, then adjust the variable resistor to make the voltmeter show 13.5 V.
In this time, judge as normal if the output current is 50 A or more.

CAUTION:

- Do not cut off battery circuit during generator rotating.
- Do not connect to L terminal if the charging lamp (12 V-3 W) is not used.
- Never connect L terminal and B circuit directly. Diode for excitation may be broken.
- Use the following wire to connect between B terminal and the battery (+) terminal, or E terminal and the battery (−) terminal: sectional area 8 mm² {0.012 in²} or more, length 2.5 m {8.2 ft} or less.
Handling

Be careful with the following when handling a generator.

- Connecting the polarities of battery inversely causes generator diode to be broken.
- While the engine runs, never disconnect the wiring of battery terminal and charging circuit.
- Wiring connection to terminal must be performed properly according to terminal symbol.
- Do not perform megger test on semiconductor device.
- Be sure to disconnect the battery terminal (−) before inspection on equipment.
- Do not open/close the battery relay switch while the engine runs.
- Disconnect the battery terminal when charging from external source such as quick charge.
- Do not pour steam cleaner or water directly on it.
- Refer to 1A-14, “Installation, Engine Accessories” for tension adjustment of V-belt.

Generator (12V-35A Hitachi, Ltd.)

Structure

![Diagram of generator structure]

![Electrical schematic diagram]

![Graph showing output current vs. alternator speed]

Output Current at 13.5V

Alternator Speed (r/min x 10^3)
Removal

- Battery ground cable
1. Electrical wiring at the generator.
2. Loosen the adjusting nut.
3. Loosen the ACG adjusting bolt.
4. Loosen the lower mounting bolt.
   - Loosen the lower mounting bolt while holding the nut located on the back using a tool.
5. Drive belt.
6. Generator.

Installation

1. Generator.
   - Tighten the lower mounting bolt while holding the nut located on the back using a tool.
2. ACG adjusting bolt.
3. Adjusting nut.

Tightening torque:
- M8 bolt: 18.6 — 28.4 N·m (1.9 — 2.9 kgf·m/13.7 — 20.9 lb·ft)
- M10 bolt: 41.2 — 55.0 N·m (4.2 — 5.6 kgf·m/30.4 — 40.6 lb·ft)

4. Electrical wiring at the generator.
   - Battery ground cable
   - Install wiring (AV5.0 mm², black) from the negative terminal of the generator to the engine ground and connect it to ground securely.

12. Diode
13. Brush Holder
14. Terminal Bolt

Performance Test
In the performance test of generator, connect as follows and measure the regulated voltage and output current.
Actual wiring diagram for performance test of IC regulator built-in generator

Name
1. Voltmeter
2. Charging Lamp 12V-3 W
3. Ammeter
4. Battery 12 V
5. Variable Resistor
6. 0.25Ω Resistor

Regulated voltage measurement of regulator
Close SW1 switch, and raise the generator speed to approximately 5,000 rpm. If a voltmeter shows between 14.1 and 14.8 V, the regulated voltage of regulator is normal.
Replace the regulator if the voltmeter shows out of range between 14.1 and 14.8 V.

Specified value of regulated voltage
14.1 — 14.8 V (+20°C {68°F})

13.5 V generated speed
Close SW1 switch and gradually raise the generator speed until a voltmeter shows 13.5 V, then measure the speed.
Judge as normal if the current speed is 1,000 rpm or less.

Measurement of the output current
Close SW1 and SW2 switches and raise the generator speed to 5,000 rpm, then adjust the variable resistor so that the voltmeter shows 13.5 V.
In this time, judge as normal if the output current is 35 A or more.

CAUTION:
- Do not cut off battery circuit during generator rotating.
- Do not connect to L terminal if the charging lamp (12V-3 W) is not used.
  Never connect L terminal and B circuit directly. Diode for excitation may be broken.
- Use the following wire to connect between B terminal and the battery (+) terminal, and E terminal and the battery (−) terminal: sectional area 8 mm² {0.012 in²} or more, length 2.5 m {8.2 ft} or less.
Handling

Be careful with the following when handling a generator.

- Connecting the polarities of battery inversely causes generator diode to be broken.
- While the engine runs, never disconnect the wiring of battery terminal and charging circuit.
- Wiring connection to terminal must be performed properly according to terminal symbol.
- Do not perform megger test on semiconductor device.
- Be sure to disconnect the battery terminal (−) before inspection on equipment.
- Do not open/close the battery relay switch while the engine runs.
- Disconnect the battery terminal when charging from external source such as quick charge.
- Do not pour steam cleaner or water directly on it.
- Refer to 1A-14, “Installation, Engine Accessories” for tension adjustment of V-belt.

Output current at 13.5V
Removal

- Battery ground cable
1. Electrical wiring at the generator.
2. Loosen the adjusting nut.
3. Loosen the ACG adjusting bolt.
4. Loosen the lower mounting bolt.
   - Loosen the lower mounting bolt while holding the nut located on the back using a tool.
5. Drive belt.
6. Generator.

Installation

1. Generator.
   - Tighten the lower mounting bolt while holding the nut located on the back using a tool.
2. ACG adjusting bolt.
3. Adjusting nut.

Tightening torque:
- M8 bolt: 18.6 — 28.4 N·m (1.9 — 2.9 kgf·m/13.7 — 20.9 lb·ft)
- M10 bolt: 41.2 — 55.0 N·m (4.2 — 5.6 kgf·m/30.4 — 40.6 lb·ft)

4. Electrical wiring at the generator.
   - Battery ground cable
   - Install wiring (AV5.0 mm², black) from the negative terminal of the generator to the engine ground and connect it to ground securely.

Starting System

General Description

The starter is a 2.2 kW (Mitsubishi) or 2.0 kW (DENSO).

Name

1. Starter
Service Precautions

Handling of starter

1. Precautions on handling
   - Improper gap between pinion and ring gear causes faulty mesh. (Gap 2 — 3.5 mm (0.079 — 0.138 in))
   - Also, the front bracket is installed on the engine side securely.
   - Be sure to turn off the battery switch before removal/installation of starter.
   - Tightening/inserting wiring must be performed properly. Looseness causes starting trouble due to high contact resistance.

2. Precautions on starting
   - Be careful with charging status of battery. Insufficiently-charged battery causes starting trouble.
   - After checking engine starting, turn off the starter switch immediately.
   - One continuous use should be less than 10 seconds. If re-starting is needed, wait until the pinion stops completely.
   - If the starter does not stop rotating when the starter switch is turned off, turn off the battery switch immediately. In this case, check the wiring, switch, etc.

List of Trouble Symptom

<table>
<thead>

**Inspection**

**CAUTION:**
Complete each test within three to five seconds.

**Pull-in test**
1. Disconnect the lead wire of the C terminal.
2. When connecting as follows, make sure that the pinion gear protrudes.

**CAUTION:**
When performing the inspection, be sure to disconnect the lead wire of the C terminal.

**Hold-in test**
1. Make sure that the pinion gear remains out even after disconnecting the test lead wire of the C terminal with pull-in test condition.
2. Disconnect the ground wire and make sure that the pinion gear returns to its original position.

**Return test**
1. When connecting as follows, make sure that the pinion gear protrudes. When disconnecting the lead to the 50 terminal with the connection, make sure that the pinion gear returns to its original position immediately.

**Note:**
If you need repairing, bring it to the nearest DENSO service station for needing the special tools in disassemble and assemble.

Engine Coolant Temperature Control

The EGR valve is opened when the engine coolant temperature becomes 60°C (140°F) or more, and is closed when 55°C (131°F) or less.

Control When the Sensor Has an Open Circuit

The following sensors perform backup control when they have an open circuit. In this case, EGR valve operates according to other normal sensors.

<table>
<thead>
<tr>

Inspection
EGR valve check
1. Shine a light from the direction shown in the illustration.
2. Replace the EGR cut solenoid and valve case together if the light can be seen from the opposite side. The EGR valve has been stuck at opened position.

Lubrication System

Service Precautions

- During each disassembly, remove the old gasket adhering to each part and mating part completely using a scraper at the location, where the fluid gasket is to be used, clean the traces of oil, moisture and dirt completely using a cloth, and apply the specified new fluid gasket at each location.
- Avoid excessive or insufficient coating volume. Note that seizure may occur in case of excessive coating due to clogging of the oil gallery and oil jet, and oil and water leakage may occur if the coating is insufficient.
- Always, the start and end of the application should be overlapped.

Explanations on Functions and Operation

The lubrication system uses the filter element combined with a full flow bypass, water-cooled oil cooler, and oil jet for piston cooling.

Lubricating system diagram
Function Check

Engine oil

- Ensure the engine is at a level ground. Before starting the engine or when 5 minutes or more have elapsed after stopping the engine, check the engine oil volume using the level gauge. The volume is appropriate if the engine oil is between the upper and lower limits of the level gauge. Replenish the engine oil, if level is below the lower limit. Also, check for contamination of the engine oil.

Note:
Oil level gauge installation position and shape are different depending on the model.

Engine oil leakage

- In the lift up condition, confirm that there are no leaks from the cylinder head cover and oil pan.
Oil Filter

Removal
Remove the oil filter using the oil filter wrench.

Remote filter type

![Remote Filter Diagram]

Cartridge type

![Cartridge Filter Diagram]

Installation
1. Apply engine oil to the O-ring of the oil filter.
2. Install the oil filter using the oil filter wrench.

Inspection

Replace or repair if there is wear, damage, or any other defect on the rotor, etc.

Inspection of clearance between the outer or inner rotor and the pump cover

Use a thickness gauge and square to measure the clearance between the outer or inner rotor and the pump cover, and replace the outer or inner rotor if they exceed the limit.

List of Trouble Symptom ........................................ 1K-2
Preheating System

Explanations on Functions and Operation
The preheating system consists of the glow plug timer, the glow plugs and the glow indicator lamp. The preheating system is operated when the engine coolant temperature is low, and makes the engine easy to start.

Glow Plug Check
- Use the circuit tester and measure the resistance of the glow plug.
- If the measured value deviates from the specified value, then replace the glow plug.

Resistance value of glow plug is 3Ω.

Note:
Use a set of glow plug from the same manufacturer.
